# 1 Introduction

**NOTE: Emulator will be featured in NetSim only if Licenses for Emulator Add-on is available**

A network simulator mimics the behaviour of networks but cannot connect to real networks. NetSim Emulator enables users to connect NetSim simulator to real hardware and interact with live applications.

## 1.1 Emulation: How Simulation interacts with the real world

A real PC (running NetSim Emulation Client) sends live traffic to the PC (running NetSim Emulation Server). Whenever a packet arrives at the interface of server, this packet is “converted” into a simulation packet and sent from a source node (user selectable) in the simulated network (user configurable) to a destination node (again user selectable). Upon receipt of this packet at the destination, the packet is then “re-converted” and sent back to a real PC destination node (running NetSim Emulation Client). The real packet thus undergoes network effects such as delay, loss, error etc. created virtually by NetSim Simulator.

## 2 Emulation Set-up

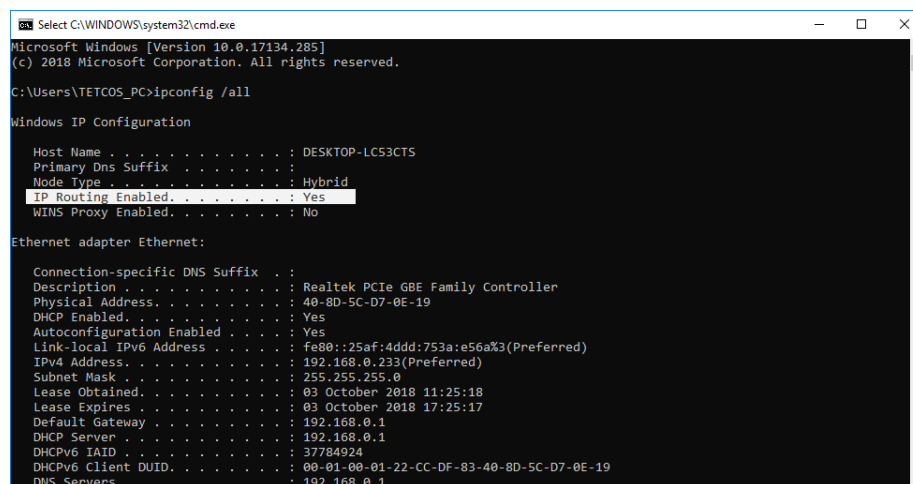

The ideal set-up to run emulation would be to have a minimum of three (3) PC's. One would be the real source, the second would run NetSim emulation server, and the third would be the real destination.

Alternately, this set-up can also be managed where the two (2) PC's are running client applications that communicate with the central server, where NetSim Emulation server is running.

### Prerequisite for NetSim Emulation: Enabling IP routing in windows

IP Routing is the process that allows data to cross over a network of computers rather than just one. Routing is often disabled by default in Windows, to check whether IP routing enabled or not.

Open Command Prompt (cmd.exe) type **ipconfig /all**. It will show if IP Routing Enabled: **Yes\No**. If IP Routing Enabled is set to **No** we may have to manually enable IP routing.

```
Select C:\WINDOWS\system32\cmd.exe
Microsoft Windows [Version 10.0.17134.285]
(c) 2018 Microsoft Corporation. All rights reserved.

C:\Users\TETC05_PC>ipconfig /all

Windows IP Configuration

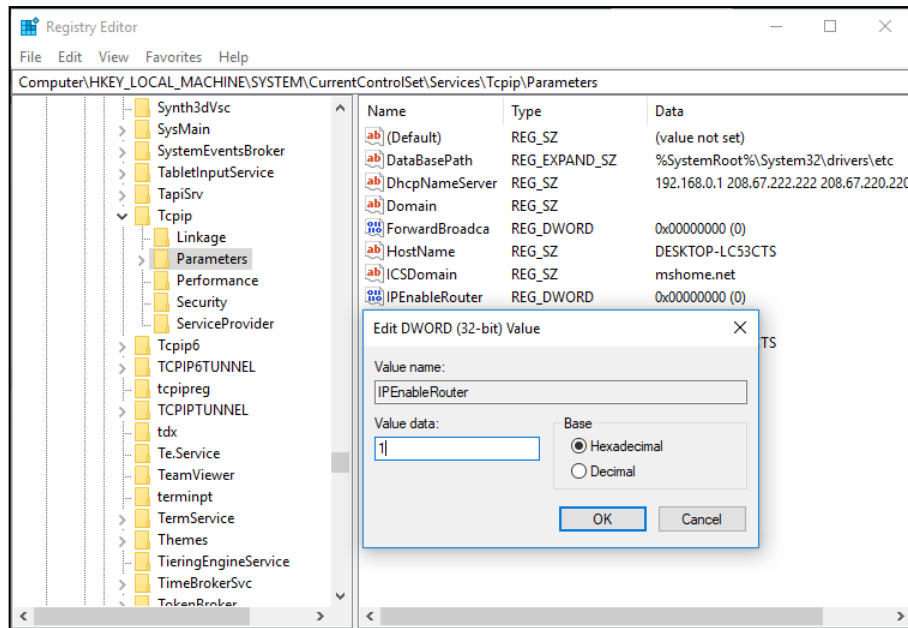

Host Name . . . . . : DESKTOP-LC53CTS
Primary Dns Suffix . . . . . :
Node Type . . . . . : Hybrid
IP Routing Enabled. . . . . : Yes
WINS Proxy Enabled. . . . . : No

Ethernet adapter Ethernet:

Connection-specific DNS Suffix . . :
Description . . . . . : Realtek PCIe GBE Family Controller
Physical Address. . . . . : 40-8D-5C-D7-0E-19
DHCP Enabled. . . . . : Yes
Autoconfiguration Enabled . . . . : Yes
Link-local IPv6 Address . . . . . : fe80::25af:4ddd:753a:e56a%3(Preferred)
IPv4 Address. . . . . : 192.168.0.233(Preferred)
Subnet Mask . . . . . : 255.255.255.0
Lease Obtained. . . . . : 03 October 2018 11:25:18
Lease Expires . . . . . : 03 October 2018 17:25:17
Default Gateway . . . . . : 192.168.0.1
DHCP Server . . . . . : 192.168.0.1

DHCPv6 Client DUID. . . . . : 00-01-00-01-22-CC-DF-83-40-8D-5C-D7-0E-19
DNS Servers . . . . . : 192.168.0.1
```

### Steps to enable IP routing in windows:

1. Open the start menu, and type REGEDIT32.EXE into the search box. Hit enter. You can also click on "Run" and type REGEDIT to open it.
2. Navigate to the  
**HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters**  
**IPEnableRouter** setting
3. Right click and select Modify. Change **0** to **1** and click OK then exit the editor

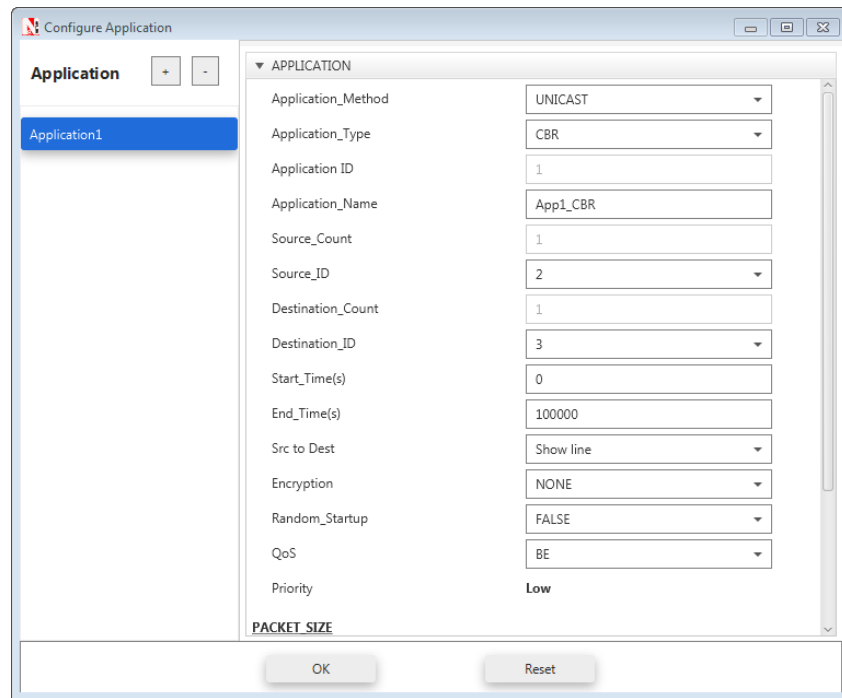

4. Restart the system and check if IP Enabled Router is set to Yes by using the command **ipconfig /all**

## 2.1 Setting up the NetSim Server:

**Note:** Never use NetSim License server as Source or destination for emulation application. Also if the license server is running on Virtual Machine (VM) then any VM on that physical system cannot be used as source or destination. If used, this will lead to license check out problems in the license server.

- Run NetSim in Administrative Mode (Right Click on NetSim.exe → Run as Administrator).
- User has to open any Stack based Network (Any network except Legacy Networks and Cellular Network) in NetSim with Emulation.
- Create a network scenario of your choice (refer application examples provided) and set the Application properties.

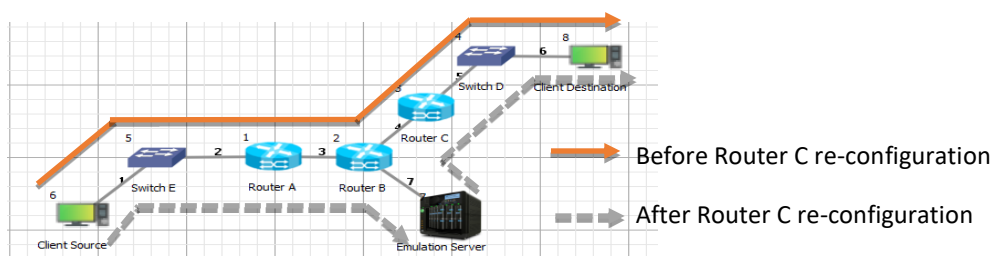

- In the Application Properties, set Application Type as “EMULATION”. Assign real Source IP address and Destination IP address in the respective fields. Then Click OK.
- Set the Simulation Time as how long you want to perform the Emulation in Real World. **Do not run the simulation until setting up Emulation in the Client system.**

**NOTE: If the Emulation Server is located in a different subnet from clients**

- User has to configure the router settings of the real-world network so as to allow the packets to be transmitted to the Emulation Server

For Example, if we consider a sample real world network scenario where the Emulation clients and server are located in different subnets

- Routing table of router 3 needs to be configured such that any packet having Source Address as IP Address of Node 6(Client Source) and Destination Address as IP

Address of Node 8(Client Destination) must be routed to Emulation Server. NetSim configuration will ensure that the packet is re-injected with destination set to the appropriate IP Address (set in the application properties)

## 2.2 Setting up the Client systems (Real Source and Destination system)

- Open command prompt in administrative mode.

- Type command,

**route delete <Network Address>**

Then press Enter key. You will get “OK”. For example if your IP address is 192.168.0.4 and the subnet mask is 255.255.255.0 then the network address is 192.168.0.0 (Got by performing a bitwise AND of the IP Address and the subnet mask)

- Type command

**route add <Network Address>mask 255.255.255.0 <IP Address where NetSim Emulation server is running> metric 1**

Here the subnet mask is taken as 255.255.255.0). After execution, you will get “OK”.

- Type command

**netstat -r**

To check if the IP configuration is done or not.

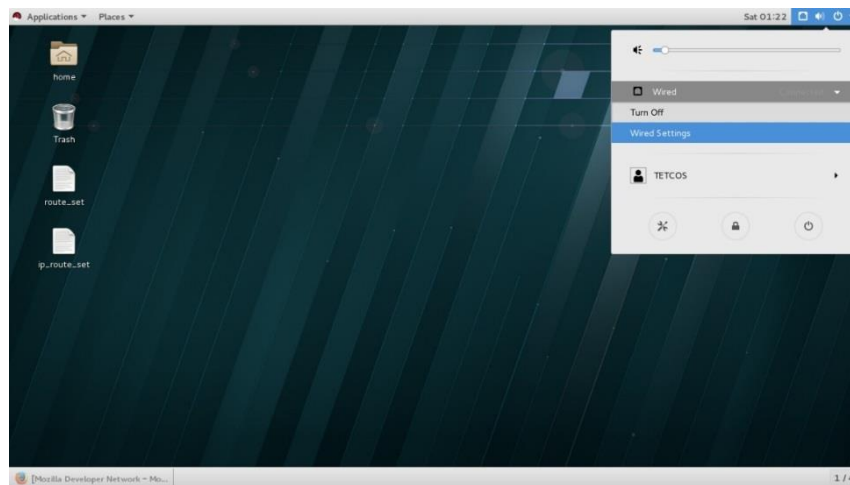

**Note that in the above screenshot, for the network 192.168.0.0, the gateway address assigned is 192.168.0.87(Address of the system where NetSim Emulation Server is running).**

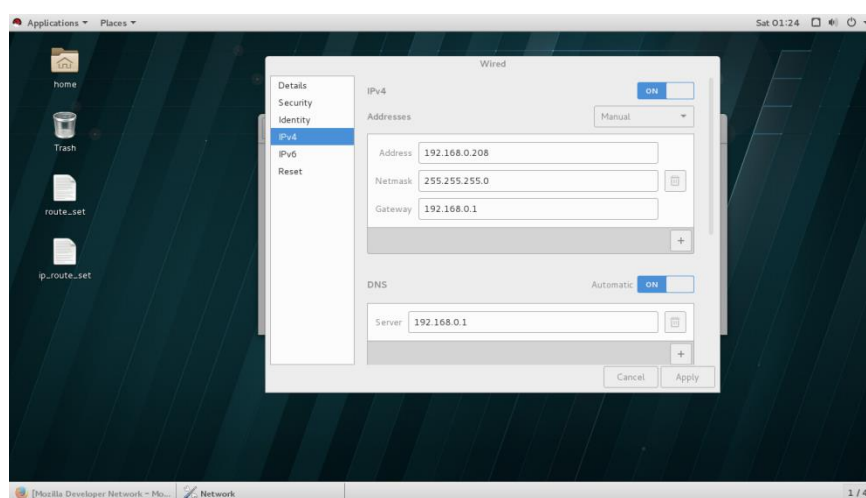

## 2.3 Setting up the Linux Clients (Real Source and Destination systems)

**Note: Following Screenshots are relevant to RHEL 7. Equivalent settings has to be done in case of other Linux Variants.**

Go to the Wired Settings option in the Network Adapter Icon.

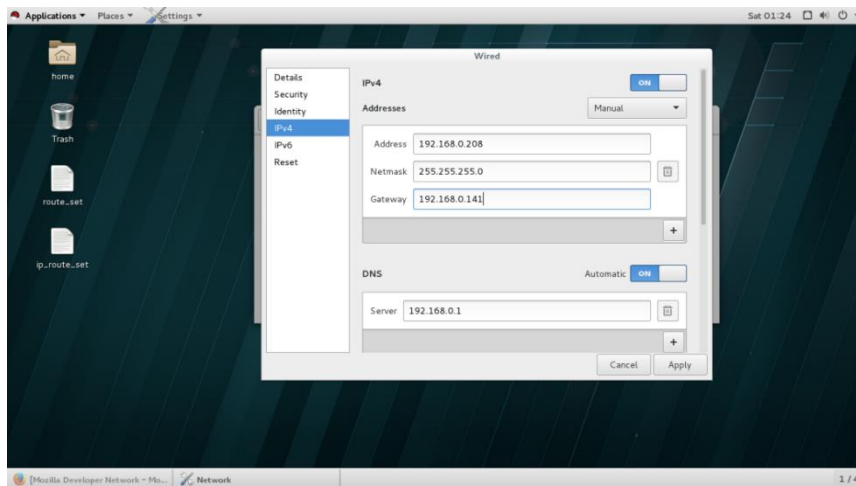

In the IPV4 settings, set static IP Address to the machine and specify the Emulation Server IP as the Gateway IP.

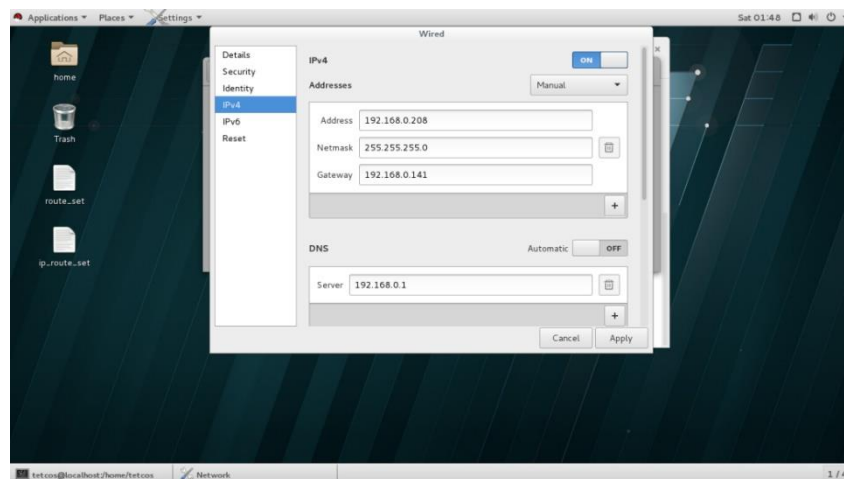

Example: If 192.168.0.141 is the IP of the system where Emulation Server is running. This is specified as the gateway IP.

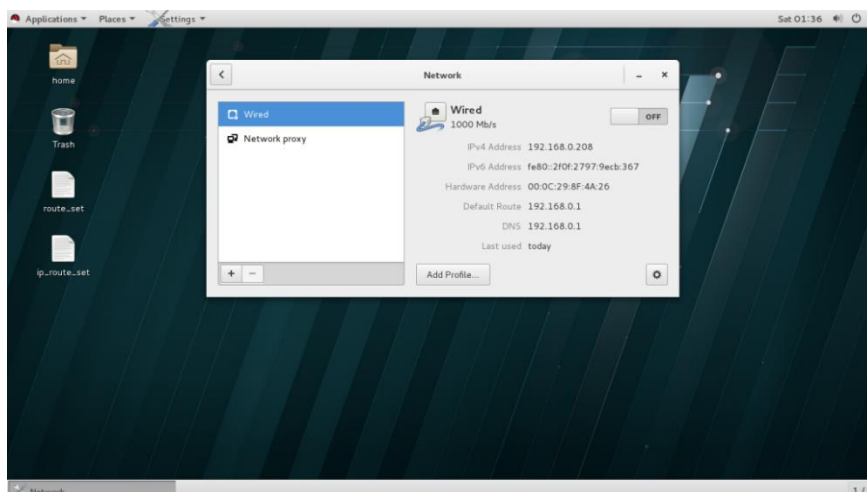

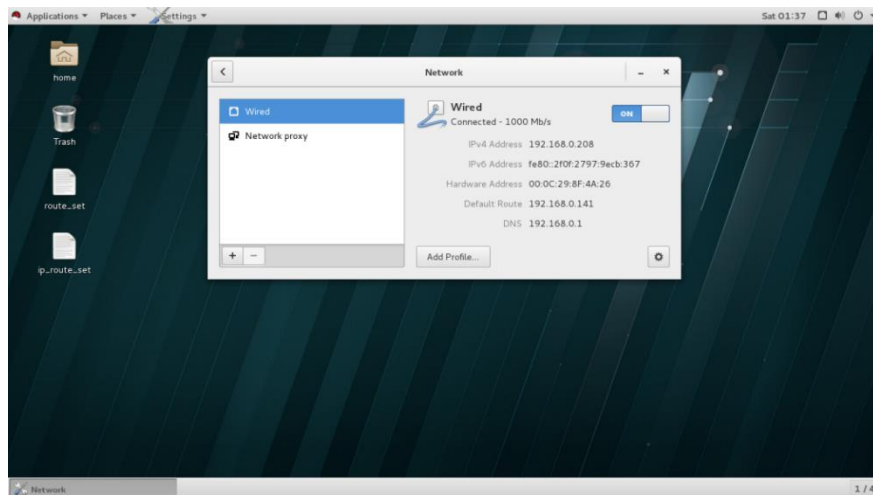

Turn off Automatic DNS.

Turn off and on the Network Adapter

Open terminal window

**Type command**

**su**

This is to switch to root user.

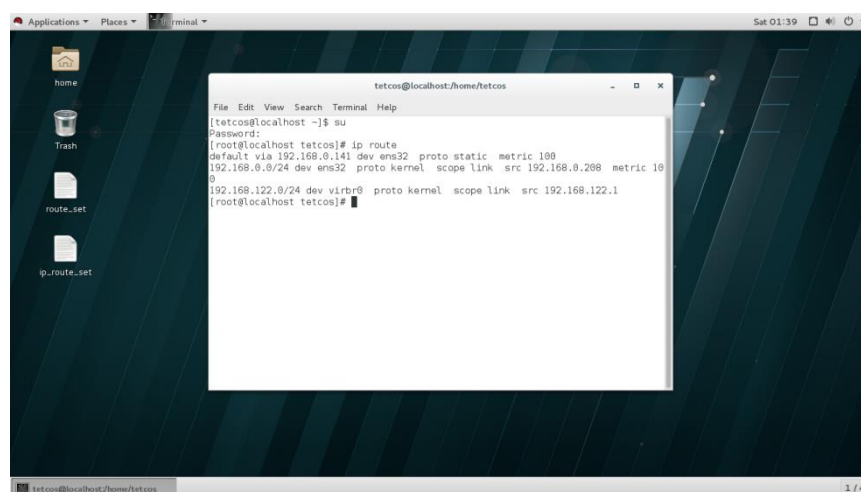

Enter the root password

**Type command**

**ip route**

This is to check the default route

It will now show the default via <Emulation server IP>

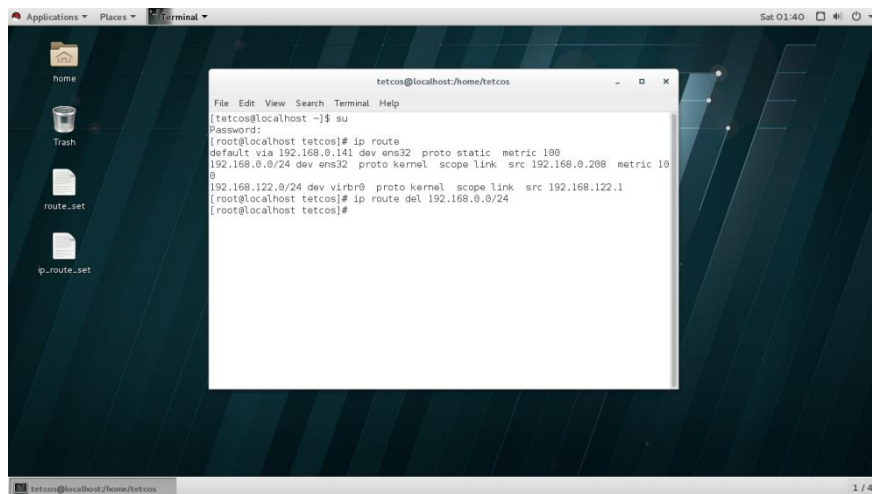

**Type command**

Ver 12.0

10

## ip route del <Network Address>

A screenshot of a Linux desktop environment with a terminal window open. The terminal shows the following commands and output:

```
tetcos@localhost/home/tetcos
File Edit View Search Terminal Help
[tetcos@localhost ~]$ su
Password:
[root@localhost tetcos]# ip route
default via 192.168.0.141 dev ens32 proto static metric 100
192.168.0.0/24 dev ens32 proto kernel scope link src 192.168.0.208 metric 100
192.168.122.0/24 dev virbr0 proto kernel scope link src 192.168.122.1
[root@localhost tetcos]# ip route del 192.168.0.0/24
[root@localhost tetcos]#
```

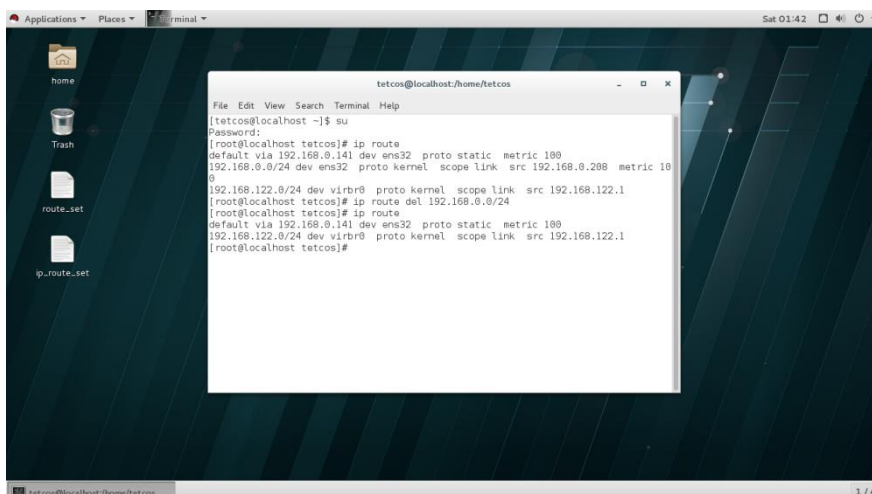

Example:

**ip route del 192.168.0.0/24**

Type command

**ip route**

This is to check if the IP configuration is done.

A screenshot of a Linux desktop environment with a terminal window open. The terminal shows the following commands and output:

```
tetcos@localhost/home/tetcos
File Edit View Search Terminal Help
[tetcos@localhost ~]$ su
Password:
[root@localhost tetcos]# ip route
default via 192.168.0.141 dev ens32 proto static metric 100
192.168.0.0/24 dev ens32 proto kernel scope link src 192.168.0.208 metric 100
192.168.122.0/24 dev virbr0 proto kernel scope link src 192.168.122.1
[root@localhost tetcos]# ip route del 192.168.0.0/24
[root@localhost tetcos]# ip route
default via 192.168.0.141 dev ens32 proto static metric 100
192.168.122.0/24 dev virbr0 proto kernel scope link src 192.168.122.1
[root@localhost tetcos]#
```

## 2.4 Setting up the Communication with Raspberry PI

Open Raspberry PI terminal and apply “**sudo su**”

- Apply “**nano /etc/sysctl.conf**” command and edit the file by adding the following comment

**net.ipv4.ip\_forward=1**

- To save and Exit  
[Ctrl] + X, then chose yes or no
- Apply “nano /etc/sysctl” command
- Then add the following comments
  - a. IP\_DYNIP=”no”
  - b. IP\_TCP\_SYNCOOKIES=”yes”
  - c. IP\_FORWARD=”yes”
- Follow step 3

```

# server, but it should not be run by default.
nohook lookup-hostname

interface eth0
inform 192.168.0.124
static routers=192.168.0.53
static domain_name_servers=192.168.0.1
static domain_search=192.168.0.1

```

- Apply “nano /etc/dhcpd.conf”
  - a. change the ”static routers” to NetSim Server IP as shown in the below image
- Apply “route” command

```

Destination      Gateway         Genmask         Flags Metric Ref    Use Iface
default          192.168.0.53   0.0.0.0         UG    202    0      0 eth0
192.168.0.0      *              255.255.255.0   U     202    0      0 eth0

```

- Apply “ip r del <network ip>/24”

```

root@tetcos:/etc# ip r del 192.168.0.0/24
root@tetcos:/etc# route
Kernel IP routing table
Destination      Gateway         Genmask         Flags Metric Ref    Use Iface
default          192.168.0.53   0.0.0.0         UG    202    0      0 eth0

```

### Example: ip r del 192.168.0.0/24

- Apply “ping <any ip within the network>”. Example: ping 192.168.0.202

```

root@tetcos:/etc# ping 192.168.0.202
PING 192.168.0.202 (192.168.0.202) 56(84) bytes of data.
From 192.168.0.53: icmp_seq=1 Redirect Network(New nexthop: 192.168.0.202)
64 bytes from 192.168.0.202: icmp_seq=1 ttl=64 time=0.758 ms
From 192.168.0.53: icmp_seq=2 Redirect Network(New nexthop: 192.168.0.202)
64 bytes from 192.168.0.202: icmp_seq=2 ttl=64 time=0.749 ms
From 192.168.0.53: icmp_seq=3 Redirect Network(New nexthop: 192.168.0.202)
64 bytes from 192.168.0.202: icmp_seq=3 ttl=64 time=0.742 ms
From 192.168.0.53: icmp_seq=4 Redirect Network(New nexthop: 192.168.0.202)
64 bytes from 192.168.0.202: icmp_seq=4 ttl=64 time=0.701 ms
From 192.168.0.53: icmp_seq=5 Redirect Network(New nexthop: 192.168.0.202)

```

## 2.5 Setting up the network for client systems communicating across the network

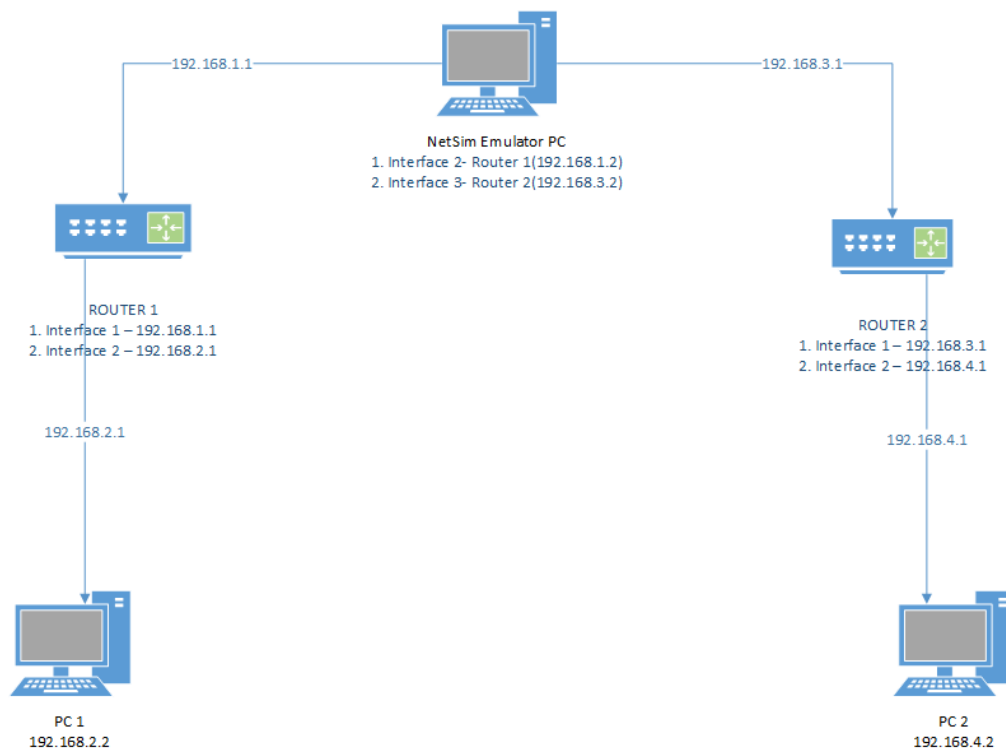

Devices communicating across networks can be connected to NetSim Emulator. This is achieved by connecting the system running NetSim to the routers which connect to the client machines taking part in communication.

### 2.5.1 System Configuration

Connecting devices across network to NetSim emulator involves configurations at the router and in the NetSim Emulator system. There is no configuration required in the client systems communicating across the network, unlike the case of emulation within the same network.

- The System running NetSim Emulator will require two or more Network Interface Cards (NICs) to connect to different networks.
- Static routes should be set to route packets to specific Network Interfaces as they come in.
- Static routes should be set for routing any external network traffic to the interface that connects to NetSim emulator.

Consider the network shown in the figure below:

PC 1 and PC 2 are connected to Router 1 and Router 2 respectively. NetSim Emulation PC connects to Router 1 in one of its interface and Router 2 in the other.

To send packets exchanged between PC1 and PC2 via NetSim Emulator, following settings are to be done:

### **Router 1**

Route is added to send any packet to PC 2(192.168.4.2), to NetSim Emulator interface that is connected to it. (Interface with IP 192.168.1.2)

### **Router 2**

Route is added to send any packet to PC 1(192.168.2.2), to NetSim Emulator interface that is connected to it. (Interface with IP 192.168.3.2)

### **NetSim Emulator**

Route is added to send any packet to PC1(192.168.2.2), to its first interface (192.168.1.2)

Route is added to send any packet to PC2(192.168.4.2), to its second interface (192.168.3.2)

After performing the above settings, packets from PC 1 to PC 2 will take the following route:

PC 1 -> NetSim Emulator Interface 1 -> NetSim Emulator Interface 2 -> PC 2

And vice versa for packets from PC 2 to PC 1.

## **2.6 Setting up the network for Database PostgreSQL Emulation**

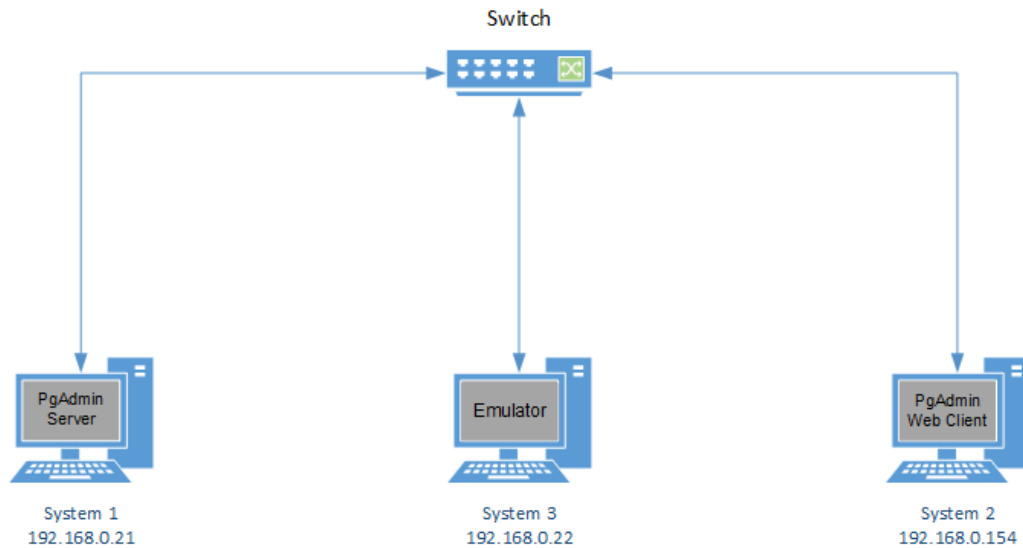

Devices running Database Management Systems such as PostgreSQL can be connected to NetSim Emulator. This is achieved by connecting the systems running the database server, the database web client and the system running NetSim Emulator to a switch.

### **2.6.1 System Configuration**

Connecting devices involved in database application to NetSim emulator involves configurations at both the systems that run the database server and the web client.

- Static routes should be set to route all outgoing packets to the system running NetSim Emulator.

Consider the network shown in the figure below:

System 1, System 2 and System 3 are connected to a L2 switch and are part of the same network.

To send packets exchanged between System 1 and System 2 via System 3(NetSim Emulator), following settings are to be done:

### System 1

Route is added to send any packet to System 2(192.168.0.154), to NetSim Emulator interface that is connected to it. (Interface with IP 192.168.0.22)

### System 2

Route is added to send any packet to System 1(192.168.0.21), to NetSim Emulator interface that is connected to it. (Interface with IP 192.168.0.22)

After performing the above settings, packets from PC 1 to PC 2 will take the following route:

**System 1**(PgAdmin Server) -> **System 3**(NetSim Emulator)-> **System 2**(PgAdmin WebClient)

And vice versa for packets from System 2 to System 1.

## 2.6.2 Steps to Start generating Network Traffic:

- Start PgAdmin application in System 1 and create a database with 100000 Records in it.

- Now open PgAdmin application in System 2 and connect to the database created in System 1. In the example shown below, we are attempting to retrieve the records from a large csv file.

Query Editor   Query History

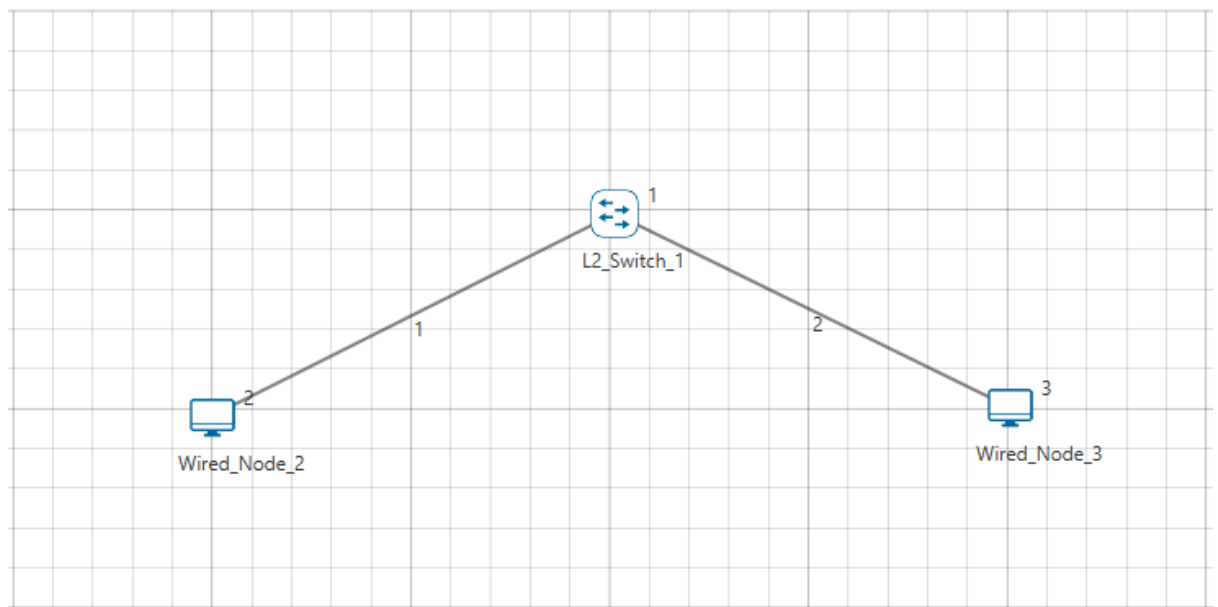

```
1 select * from Public."Event"
```

Data Output   Explain   Messages   Notifications

	event_id integer	event_type character varying (100)	event_time integer	device_type character varying (50)	device_id integer
1	1	TIMER_EVENT	0	NODE	1
2	2	TIMER_EVENT	0	NODE	2
3	3	TIMER_EVENT	0	ROUTER	4
4	4	TIMER_EVENT	0	NODE	5
5	5	TIMER_EVENT	0	NODE	1
6	6	TIMER_EVENT	0	NODE	2
7	7	TIMER_EVENT	0	SWITCH	3

### 2.6.3 Steps to configure application for NetSim Emulation:

- Once the database connection is established, In System 3, create a simple scenario in internetworks as shown below:

- Configure an Emulation Application from Wired Node 2 to Wired Node 3 as shown below:

**Configure Application**

**Application** + -

Application1  
Application2

**APPLICATION**

Application\_Name: App1\_EMULATION

Source\_Count: 1

Source\_ID: 1

Destination\_Count: 1

Destination\_ID: 2

Start\_Time(s): 0

End\_Time(s): 100000

Src\_to\_Dest: Show line

Random\_Startup: FALSE

QoS: BE

Priority: Low

**EMULATION**

Source\_Real\_IP: 192.168.0.21

Source\_Port: 0

Destination\_Real\_IP: 192.168.0.154

Destination\_Port: 0

OK Reset

- Configure an Emulation Application from Wired Node 3 to Wired Node 4 as shown below:

**Configure Application**

**Application** + -

Application1  
Application2

**APPLICATION**

Application\_Name: App2\_EMULATION

Source\_Count: 1

Source\_ID: 2

Destination\_Count: 1

Destination\_ID: 1

Start\_Time(s): 0

End\_Time(s): 100000

Src\_to\_Dest: Show line

Random\_Startup: FALSE

QoS: BE

Priority: Low

**EMULATION**

Source\_Real\_IP: 192.168.0.154

Source\_Port: 0

Destination\_Real\_IP: 192.168.0.21

Destination\_Port: 0

OK Reset

The above settings will ensure that packets from System 1 to System 2 and vice versa will be sent via NetSim Emulator.

#### 2.6.4 Results and Analysis

- Start Simulation in NetSim
- Perform any query on the database while NetSim simulation is running

- Analyse the impact of flow of the packets through the network designed in NetSim based on the time taken for the query response.
- The pcap log files such as All Network Packets Capture, Dispatched to Emulator, Reinjected from Emulator, Not Dispatched to Emulator that are accessible from the NetSim results dashboard after the simulation is over, can be used for further analysis.

## 2.7 Setting up the network for GeoServer Application Emulation

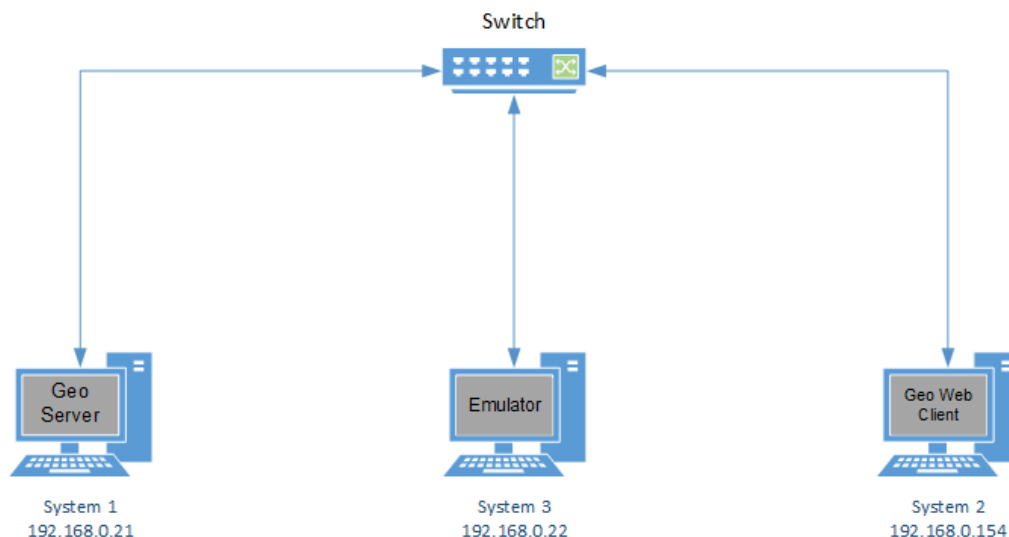

Devices running Database Management Systems such as PostgreSQL can be connected to NetSim Emulator. This is achieved by connecting the systems running the database server, the database web client and the system running NetSim Emulator to a switch.

### 2.7.1 System Configuration

Connecting devices involved in database application to NetSim emulator involves configurations at both the systems that run the database server and the web client.

- Static routes should be set to route all outgoing packets to the system running NetSim Emulator.

Consider the network shown in the figure below:

System 1, System 2 and System 3 are connected to a L2 switch and are part of the same network.

To send packets exchanged between System 1 and System 2 via System 3(NetSim Emulator), following settings are to be done:

### System 1

Route is added to send any packet to System 2(192.168.0.154), to NetSim Emulator interface that is connected to it. (Interface with IP 192.168.0.22)

### System 2

Route is added to send any packet to System 1(192.168.0.21), to NetSim Emulator interface that is connected to it. (Interface with IP 192.168.0.22)

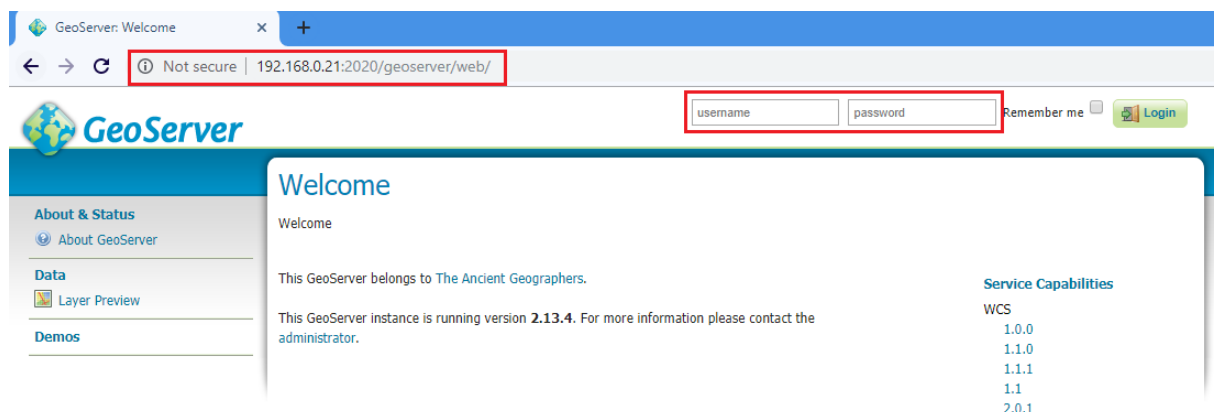

After performing the above settings, packets from PC 1 to PC 2 will take the following route:

**System 1**(Geo Server) -> **System 3**(NetSim Emulator)-> **System 2**(Geo WebClient)

And vice versa for packets from System 2 to System 1.

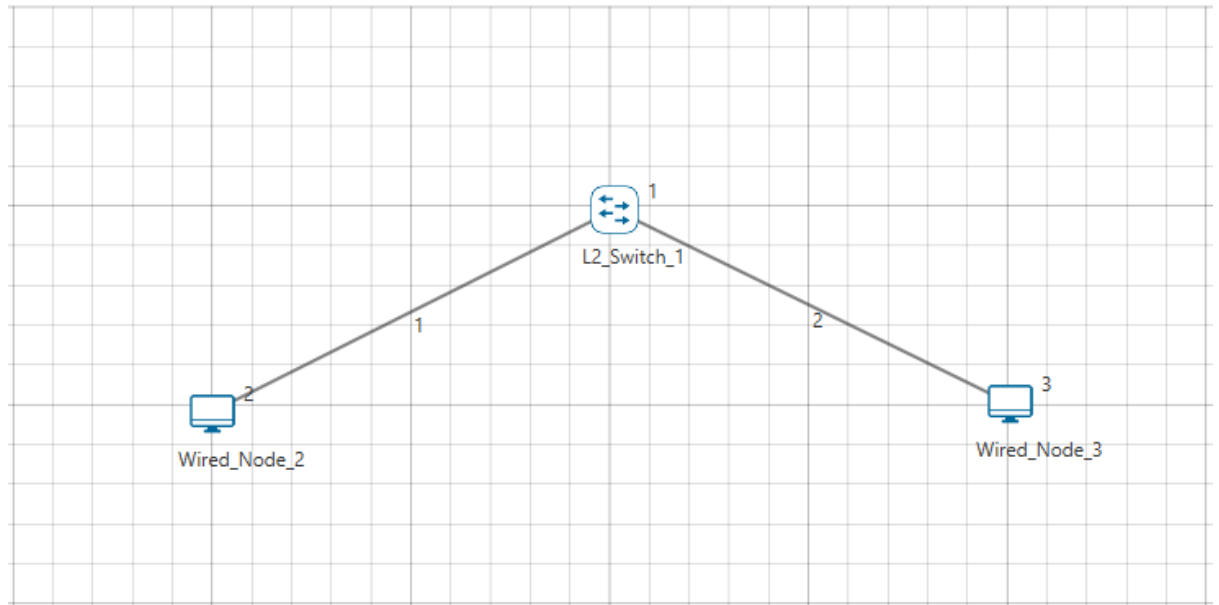

#### 2.7.2 Steps to Start generating Network Traffic:

- Start GeoServer application in System 1
- Now access GeoServer via web browser in System 2 by specifying IP address: GeoServerPort//Geoserver/browser. Eg:192.168.0.21:2020/Geoserver/browser

#### 2.7.3 Steps to configure application for NetSim Emulation:

- Once the database connection is established, In System 3, create a simple scenario in internetworks as shown below:

- Configure an Emulation Application from Wired Node 2 to Wired Node 3 as shown below:

**Configure Application**

**Application** + -

- Application1
- Application2

**APPLICATION**

Application\_Name: App1\_EMULATION

Source\_Count: 1

Source\_ID: 1

Destination\_Count: 1

Destination\_ID: 2

Start\_Time(s): 0

End\_Time(s): 100000

Src\_to\_Dest: Show line

Random\_Startup: FALSE

QoS: BE

Priority: Low

**EMULATION**

Source\_Real\_IP: 192.168.0.21

Source\_Port: 0

Destination\_Real\_IP: 192.168.0.154

Destination\_Port: 0

OK Reset

- Configure an Emulation Application from Wired Node 3 to Wired Node 4 as shown below:

**Configure Application**

**Application** + -

Application1

Application2

**APPLICATION**

Application\_Name: App2\_EMULATION

Source\_Count: 1

Source\_ID: 2

Destination\_Count: 1

Destination\_ID: 1

Start\_Time(s): 0

End\_Time(s): 100000

Src\_to\_Dest: Show line

Random\_Startup: FALSE

QoS: BE

Priority: Low

**EMULATION**

Source\_Real\_IP: 192.168.0.154

Source\_Port: 0

Destination\_Real\_IP: 192.168.0.21

Destination\_Port: 0

OK Reset

The above settings will ensure that packets from System 1 to System 2 and vice versa will be sent via NetSim Emulator.

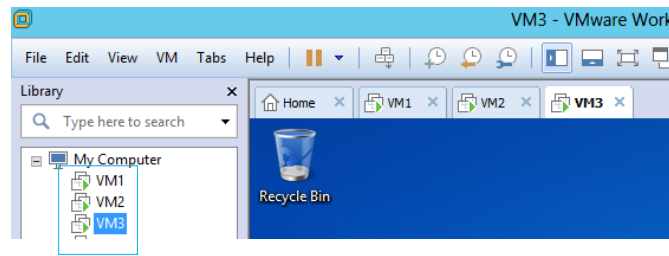

## 2.7.4 Results and Analysis

- Start Simulation in NetSim
- Try to access specific regions of the map by zooming in and other operations to generate live network traffic.
- Analyse the impact of flow of the packets through the network designed in NetSim based on the time taken for the map to load.
- The pcap log files such as All Network Packets Capture, Dispatched to Emulator, Reinjected from Emulator, Not Dispatched to Emulator that are accessible from the NetSim results dashboard after the simulation is over, can be used for further analysis.

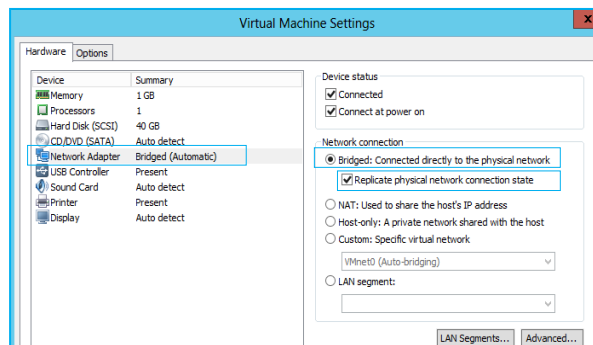

## 2.8 Setting multiple Virtual Machines (VM) to act as Nodes for Emulation

### 2.8.1 VMs sharing the same network as the host.

A computer on which one or more virtual machines are running is defined as a Host Machine. Each virtual machine is called a Guest Machine. In this scenario, we have 3 VMs running in a Host Machine – VM1, VM2 and VM3. Users can run NetSim License server in any system connected to the network in which Host Machine is running.

Now right click on each VM and select Settings. Click on Network Adapter, and select **“Bridged: Connected directly to the physical network”**. Also enable the **“Replicate Physical network connection state”**.

An advantage of this technique is that, if the license server is running in another system, connected to the same network as the original host, then NetSim running in the VM can obtain the licenses.

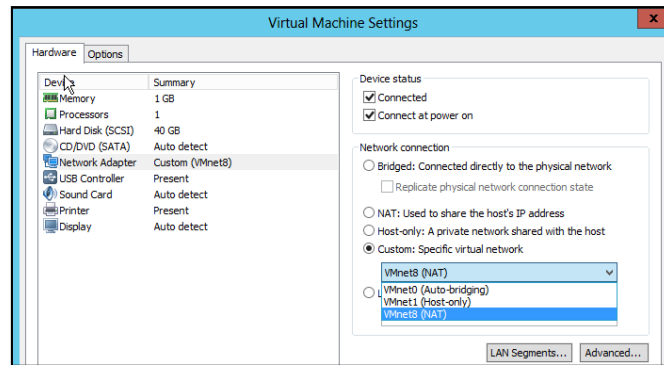

## 2.9 VMs sharing a network but insulated from the host network.

A computer on which one or more virtual machines are running is defined as a Host Machine. Each virtual machine is called a Guest Machine. In this scenario, we have 3 VMs running in a Host Machine – VM1, VM2 and VM3. NetSim License server is running in one of these 3 VMs.

If user needs to create an internal network which is segregated from host network, follow the steps

- 1 Right click on each VM and select Settings
- 2 Click on Network Adapter, and select “Custom: Specific Virtual network”
- 3 Select “VMnet8 (NAT)”

By default, a network address is assigned to this segregated network by VMware. To configure this IP address, go to EDIT → Virtual Network Editor

User can modify the Subnet IP and Subnet Mask to suit their own preference.

The disadvantage of this technique is that, if the license server must compulsorily run in the VM for NetSim to obtain the licenses.

## 2.9.1 Multicasting in NetSim Emulator using JPERF

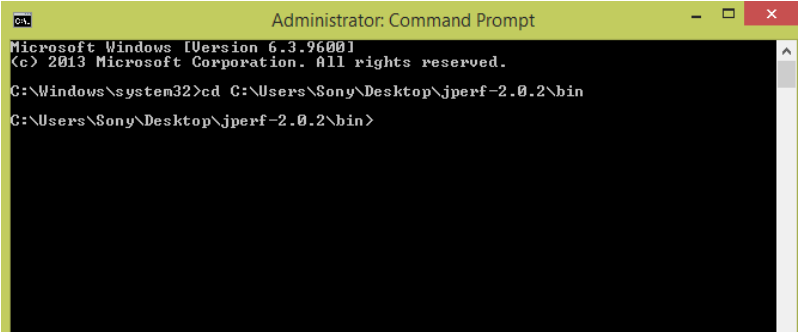

In computer\_networking, **multicast** (one-to-many or many-to-many distribution) is group communication where information is addressed to a group of destination computers simultaneously.

NetSim supports emulation of Multicast traffic with the help of Multicast client applications running on the systems taking part in multicast. NetSim provides support for both Windows and Linux machines to take part in multicast emulation.

### Using Iperf:

#### Iperf Server Setup (receiver) in Windows:

- 1 Open command window in administrator mode.
  - Copy Jperf bin path (it would look like C:\Users\Sony\Desktop\jperf-2.0.2\bin) and change the command window directory to the bin path of Jperf shown below:-

```
Administrator: Command Prompt
Microsoft Windows [Version 6.3.9600]
(c) 2013 Microsoft Corporation. All rights reserved.
C:\Windows\system32>cd C:\Users\Sony\Desktop\jperf-2.0.2\bin
C:\Users\Sony\Desktop\jperf-2.0.2\bin>
```

- Enter the following command in the command window

**iperf -s -u -B 224.0.67.67 -i 1**

The options

-s specifies server

-i specifies report interval

-u specifies UDP

-B used to bind and join to a multicast group

- Now server is listening to the traffic

```

Microsoft Windows [Version 6.3.9600]
(c) 2013 Microsoft Corporation. All rights reserved.

C:\Windows\system32>cd C:\Users\Sony\Desktop\jperf-2.0.2\bin

C:\Users\Sony\Desktop\jperf-2.0.2\bin>iperf -s -u -B 224.0.67.67 -i 1

Server listening on UDP port 5001
Binding to local address 192.168.0.103
Receiving 1470 byte datagrams
UDP buffer size: 64.0 KByte (default)
-----

```

- If any client is multicasting traffic, then the server would receive the traffic shown below:-

```

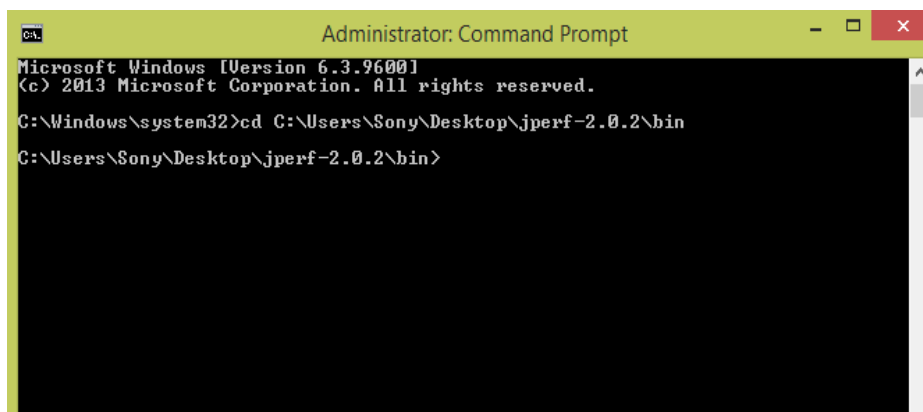

C:\Users\Sony\Desktop\jperf-2.0.2\bin>iperf -s -u -B 224.0.67.67 -i 1

Server listening on UDP port 5001
Binding to local address 192.168.0.103
Receiving 1470 byte datagrams
UDP buffer size: 64.0 KByte (default)
-----
[180] local 192.168.0.103 port 5001 connected with 192.168.0.103 port 62363
[ ID] Interval      Transfer    Bandwidth  Jitter    Lost/Total Datagrams
[180] 0.0- 1.0 sec   1.19 MBytes 10.0 Mbits/sec  0.000 ms  824209257/ 850 <9.7e
+007%>
[180] 1.0- 2.0 sec   1.19 MBytes 10.0 Mbits/sec  0.121 ms    0/ 850 <0%>
[180] 2.0- 3.0 sec   945 KBytes  7.74 Mbits/sec  1.477 ms    0/ 658 <0%>
[180] 3.0- 4.0 sec   732 KBytes  6.00 Mbits/sec  1.206 ms    0/ 510 <0%>
[180] 4.0- 5.0 sec   461 KBytes  3.77 Mbits/sec  1.069 ms    0/ 321 <0%>
[180] 5.0- 6.0 sec   668 KBytes  5.47 Mbits/sec  1.041 ms    0/ 465 <0%>
[180] 6.0- 7.0 sec   1.09 MBytes  9.18 Mbits/sec  1.022 ms    0/ 781 <0%>

```

### Iperf Client Setup (sender) in Windows:

- 1 Open command window in administrator mode
  - Copy Jperf bin path (it would look like C:\Users\Sony\Desktop\jperf-2.0.2\bin) and change the command window directory to Jperf bin path shown below

```

Administrator: Command Prompt

Microsoft Windows [Version 6.3.9600]
(c) 2013 Microsoft Corporation. All rights reserved.

C:\Windows\system32>cd C:\Users\Sony\Desktop\jperf-2.0.2\bin

C:\Users\Sony\Desktop\jperf-2.0.2\bin>

```

- Enter the following command in the command window

**iperf -c 224.0.67.67 -u -b 10m --ttl 5 -i 1 -t 50**

The options

-c specifies client

-i specifies report interval

-t specifies transmit time

-u specifies UDP

--ttl is time-to-live for outgoing multicast packets

-b specifies UDP bandwidth. Here it is 10 mbits/sec

```
C:\Users\Sony\Desktop\jperf-2.0.2\bin>iperf -c 224.0.67.67 -u -b 10m --ttl 5 -i 1 -t 50
```

-----

Client connecting to 224.0.67.67, UDP port 5001  
Sending 1470 byte datagrams  
Setting multicast TTL to 5  
UDP buffer size: 64.0 KByte (default)

-----

[ID]	Interval	Transfer	Bandwidth
[196]	0.0- 1.0 sec	1.19 MBytes	10.0 Mbits/sec
[196]	1.0- 2.0 sec	1.19 MBytes	10.0 Mbits/sec
[196]	2.0- 3.0 sec	805 KBytes	6.60 Mbits/sec
[196]	3.0- 4.0 sec	801 KBytes	6.56 Mbits/sec
[196]	4.0- 5.0 sec	490 KBytes	4.01 Mbits/sec
[196]	5.0- 6.0 sec	504 KBytes	4.13 Mbits/sec
[196]	6.0- 7.0 sec	1.05 MBytes	8.80 Mbits/sec
[196]	7.0- 8.0 sec	741 KBytes	6.07 Mbits/sec

### Iperf Server Setup (receiver) in Linux:

- We can observe the traffic generated by client in above figure.
- Now open NetSim in Administrator mode and create a simple scenario with one router and 2 wired nodes in internetworks shown below

- Click on application icon, create an EMULATION application and set client ip address in Source\_Real\_IP text box and 224.0.67.67 (multicast ip address) in Destination\_Real\_IP text box shown below:

The screenshot shows the 'Application' configuration window. On the left, a sidebar lists 'Application1'. The main area is titled 'APPLICATION' and contains the following fields:

Application ID	1
Application Name	App1_EMULATION
Source_Count	1
Source_ID	2
Destination_Count	1
Destination_ID	3
Start_Time(s)	0
End_Time(s)	100000
Src_to_Dest	Show line
Random_Startup	FALSE
QoS	BE
Priority	Low

Below the 'APPLICATION' section is the 'EMULATION' section with the following fields:

Source_Real_IP	192.168.0.207
Source_Port	0
Destination_Real_IP	224.0.67.67
Destination_Port	0

At the bottom of the window are 'OK' and 'RESET' buttons.

- Run simulation for 50 secs and observe the jitter values in the server.
- You will find the variation in jitter values with and without running simulation in NetSim
- And also change the speed, error rates and delay in the link properties and observe the variation
- If you wish to run more than 1 server, then setup another server by following the steps explained above

**NOTE:** Users need to run simulation (emulation) and the jperf client simultaneously

## 3 Model Features

### 3.1 Working of an Emulation Application in NetSim:

*Note: The following explanation is provided assuming that you have performed all necessary configuration required to divert network traffic via the system running NetSim Emulator. (This is explained in section 9 of the User Manual.*

The following parameters are specific to Emulation Application in NetSim:

Source\_Real\_IP

Source\_Port

Destination\_Real\_IP

Destination\_Port

Unlike Simulation, if users want to connect real devices running live applications to the simulator, then Emulation component is required. The Emulation Application in the traffic generator allows users to pump in real traffic into the Simulator.

The real application is mapped using the source and destination IP addresses that we set in the Emulation Application.

**Various combination of Emulation Parameters are as follows:**

**Device Specific Emulation:**

Example 1:

SOURCE\_REAL\_IP = 192.168.0.151

SOURCE\_PORT = 0

DESTINATION\_REAL\_IP = 192.168.0.202

DESTINATION\_PORT = 0

Dispatches all packets with the source real IP 192.168.0.151 and destination real IP as 192.168.0.202, into the Simulator.

Example 2:

SOURCE\_REAL\_IP = 192.168.0.151

SOURCE\_PORT = 0

DESTINATION\_REAL\_IP = 0.0.0.0

DESTINATION\_PORT = 0

Dispatches all packets from source real IP 192.168.0.151 regardless of whatever is the destination real IP, into the Simulator.

Example 3:

SOURCE\_REAL\_IP = 0.0.0.0

SOURCE\_PORT = 0

DESTINATION\_REAL\_IP = 192.168.0.202

DESTINATION\_PORT = 0

Dispatches all packets to destination real IP 192.168.0.202 regardless of whatever is the source real IP, into the Simulator.

Example 4:

SOURCE\_REAL\_IP = 0.0.0.0

SOURCE\_PORT = 0

DESTINATION\_REAL\_IP = 0.0.0.0

DESTINATION\_PORT = 0

Dispatches all packets that are reaching the Emulator Device regardless of whatever is the source or destination, into the Simulator.

**Application Specific Emulation**

Example 1:

SOURCE\_REAL\_IP = 192.168.0.151

SOURCE\_PORT = 5004

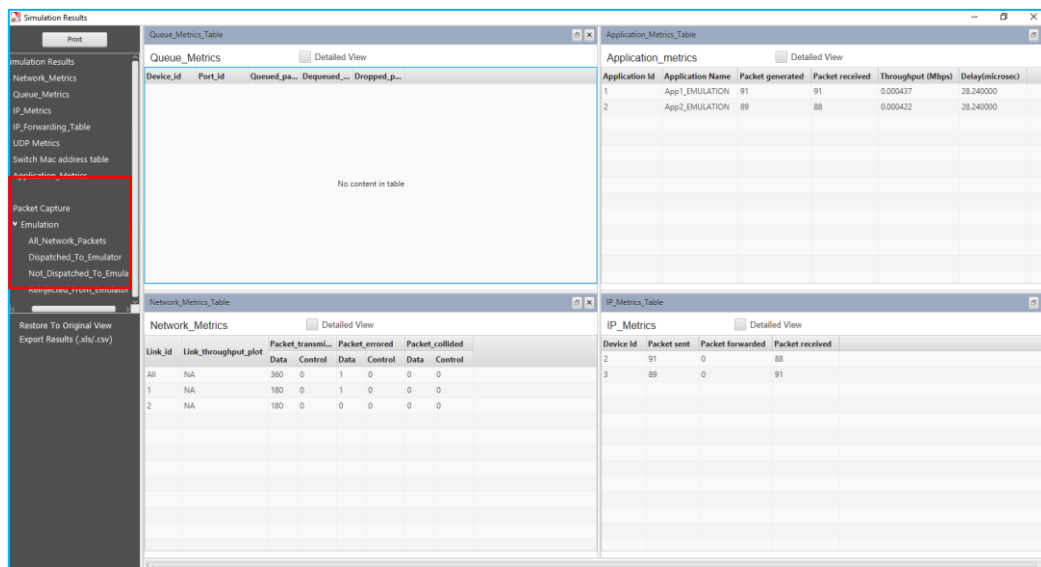

DESTINATION\_REAL\_IP = 192.168.0.202

DESTINATION\_PORT = 6245

Dispatches all packets with the source real IP 192.168.0.151, source Port No 5004, destination real IP as 192.168.0.202 and destination Port No 6245 into the Simulator.

### Emulation Specific Metrics:

On running an Emulation Application Users can optionally obtain the following log files which are Wireshark compatible .pcap files:

**All\_Network\_Packets** - Log of all packets flowing via the system running NetSim Emulator.

**Dispatched\_To\_Emulator** - Log of packets for which were sent to NetSim based on Emulation Application is configured in NetSim.

**Reinjected\_From\_Emulator** - Log of packets that successfully reached the virtual destination node in NetSim Simulator, and was re-injected into the network

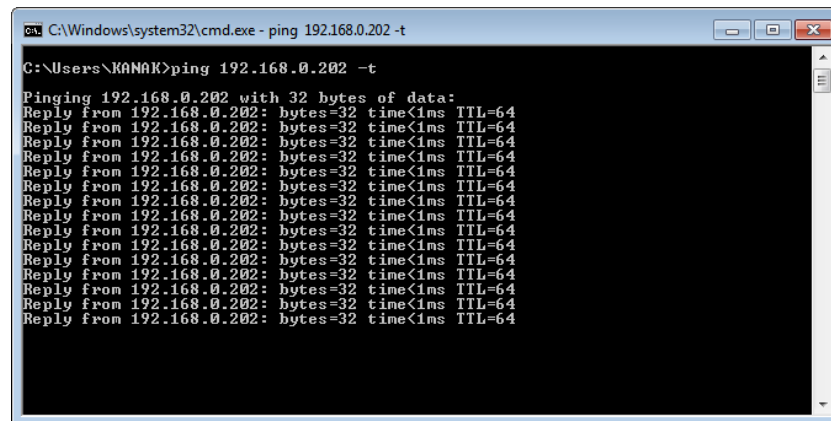

**Not\_Dispatched\_To\_Emulator** - Log of packets flowing via the system running NetSim emulator but not dispatched to emulator (All\_Network\_Packets minus Dispatched\_To\_Emulator)

#### 3.1.1 Delay measurement when ping through NetSim Emulator

Pinging through NetSim emulator takes only one direction delay, if you have set only one application with Ping Source IP and ping Destination IP. This is because PING is a two way application and constitutes PING\_REQUEST and PING\_REPLY. For ping to take round trip

delay users must configure two Emulation Applications, one for forward PING\_REQUEST and other for the reverse PING\_REPLY.

**For example: If you are running a ping from the IP 192.168.0.151 to an IP 192.168.0.202 the time take will normally be around 1ms.**

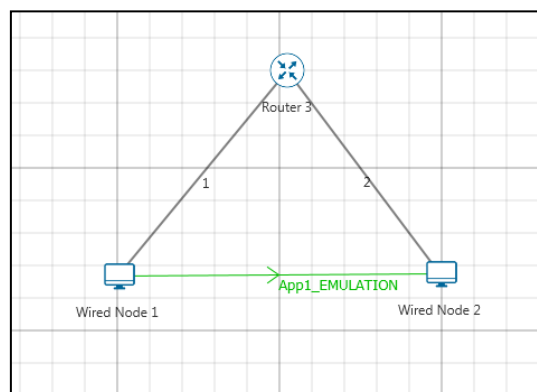

```
C:\Windows\system32\cmd.exe - ping 192.168.0.202 -t

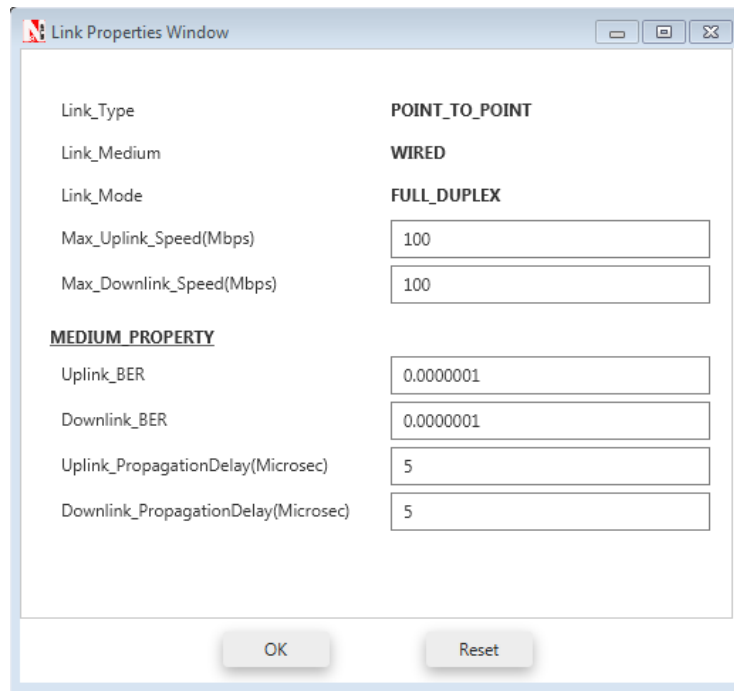

C:\Users\KANAK>ping 192.168.0.202 -t

Pinging 192.168.0.202 with 32 bytes of data:
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
```

Now we create a network scenario in NetSim similar to the screenshot shown below,

We reset the propagation delay in both the wired links to 5  $\mu$ s.

Link Properties Window

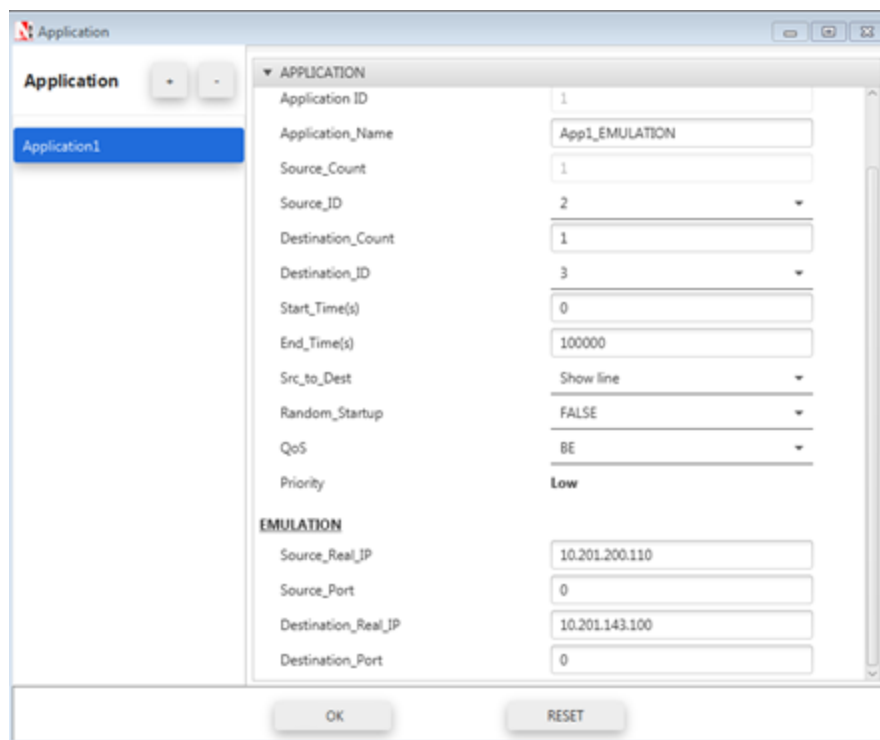

Link_Type	POINT_TO_POINT
Link_Medium	WIRED
Link_Mode	FULL_DUPLEX
Max_Uplink_Speed(Mbps)	100
Max_Downlink_Speed(Mbps)	100

**MEDIUM PROPERTY**

Uplink_BER	0.0000001
Downlink_BER	0.0000001
Uplink_PropagationDelay(Microsec)	5
Downlink_PropagationDelay(Microsec)	5

OK Reset

We configure an Emulation application between the wired nodes with the source and destination real IP specified, as shown below:

Application

Application1

**APPLICATION**

Application ID	1
Application_Name	App1_EMULATION
Source_Count	1
Source_ID	2
Destination_Count	1
Destination_ID	3
Start_Time(s)	0
End_Time(s)	100000
Src_to_Dest	Show line
Random_Startup	FALSE
QoS	BE
Priority	Low

**EMULATION**

Source_Real_IP	10.201.200.110
Source_Port	0
Destination_Real_IP	10.201.143.100
Destination_Port	0

OK RESET

On running the simulation, you will observe the variation in the time taken to get the ping reply in the source system, as shown below:

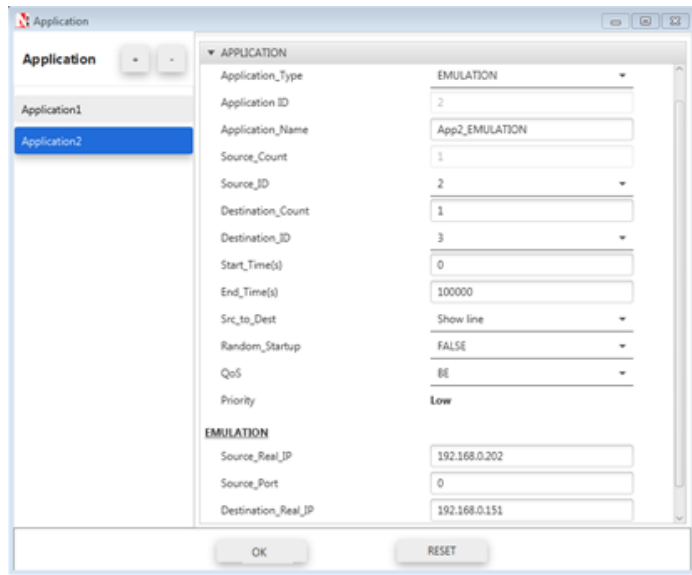

```
C:\Windows\system32\cmd.exe - ping 192.168.0.202 -t
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time=1035ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
Reply from 192.168.0.202: bytes=32 time=11ms TTL=64
```

Ping packets has experienced an additional delay of 10μs which is a sum of the delay in both the links.

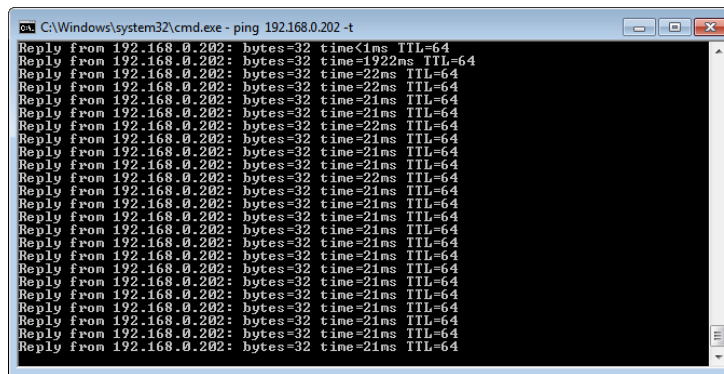

The additional delay experienced by ping packets is not 20μs because, the application that we have configured applies to only the Ping Request Packets which has the Source IP as 192.168.0.151 and Destination IP as 192.168.0.202.

The Ping Reply Packets has the Source IP as 192.168.0.202 and Destination IP as 192.168.0.151, for which we have not configured any application.

For the ping to take the round trip delay, we will have to configure one more application for the reverse traffic. On adding an application for the reverse traffic as shown below:

We will now be able to see round trip delay being experienced by the PING application, as shown below:

```
C:\Windows\system32\cmd.exe - ping 192.168.0.202 -t
Reply from 192.168.0.202: bytes=32 time<1ms TTL=64
Reply from 192.168.0.202: bytes=32 time=1922ns TTL=64
Reply from 192.168.0.202: bytes=32 time=22ms TTL=64
Reply from 192.168.0.202: bytes=32 time=22ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=22ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
Reply from 192.168.0.202: bytes=32 time=21ms TTL=64
```

Ping experiences an additional overall delay of 20ms, which is the sum of the delays experienced by Ping Request and Ping Reply (10ms + 10ms).

## 3.2 Jitter in NetSim Emulations

Jitter is defined as a variation in the delay of received packets. Let us suppose at the sending side, packets are sent in a continuous stream with the packets spaced evenly apart. Due to network congestion, improper queuing, or configuration errors, this steady stream can become lumpy, or the delay between each packet can vary instead of remaining constant. This variation in delay is 'jitter'. While there are many ways of measuring this variation, in NetSim 'jitter' is measured as the statistical variance of delay. Variance is defined as the square of deviation from the mean.

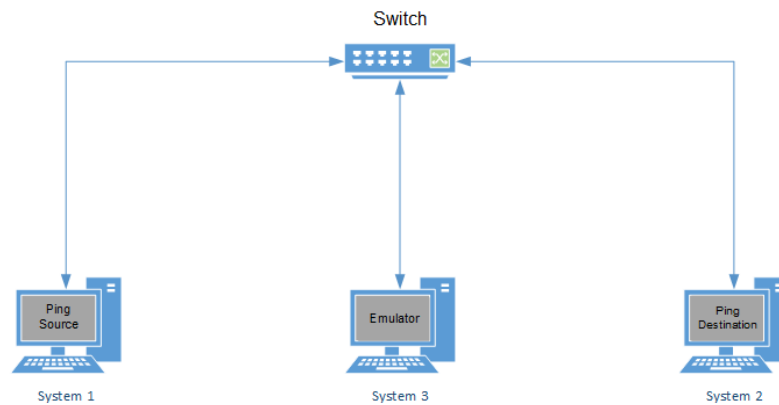

### 3.2.1 Introducing Jitter using Background traffic

Background traffic can be used to test the performance of applications when link bandwidth is consumed by other traffic. It can also be used to induce jitter for testing real-time applications.

The Background traffic in NetSim can be modelled as a Poisson process in which bursts of data of a fixed size are transmitted at an average rate such that the link will be occupied at the specified link utilization rate. Because it is a random process, over short periods the actual background traffic link utilization rate may vary from the configured value. The rate of arrival of background traffic frames affects the jitter. Larger number of background packets induce greater jitter in competing traffic. In NetSim, the way to increase the number of background packets arriving is to reduce the inter-arrival time of that application, as explained in the link <https://tetcos.freshdesk.com/support/solutions/articles/14000067807-how-do-i-introduce-jitter-in-netsim-simulations-emulations->

## 4 Featured Examples

### 4.1 Example Application 1 – PING (One way Communication)

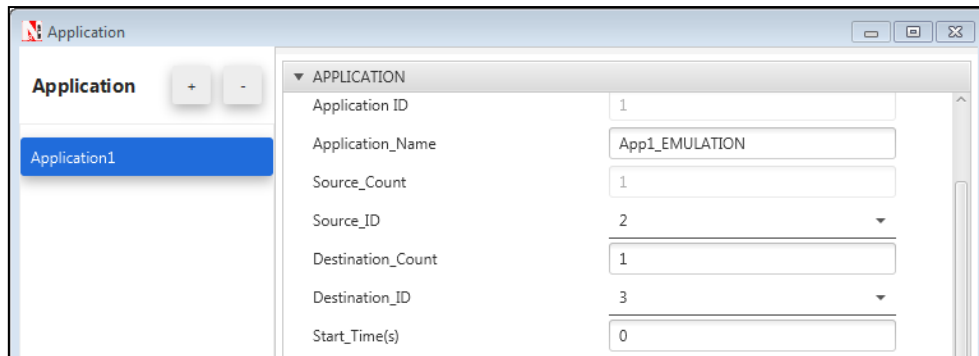

#### Steps at Emulation Server:

- 1 Run NetSim in Administrative Mode and create a basic network Scenario in any stack based protocol (Any network except Legacy Networks, Wireless Sensor Network, and Cellular Network) in NetSim. Screenshot of a sample scenario in Internetworks is shown below

- i. Go to Properties of Link1 and Link2 and set Uplink and Downlink Delay to 5000μs. Click on the Application icon present on the ribbon and set properties.
- ii. In the Application Type select Emulation.
- iii. Select Source and Destination ID according to the network scenario and change the Source and Destination IP address according to the IP address of the real system.

- i. Provide the Simulation Time as how long you want the Emulation to be performed. Make sure client system(s) are ready and then click Run Simulation.

### Steps at Source PC:

- Before running simulation, start pinging the Destination from Source using command “ping <Destination\_IP> -t” and note down the time duration.

```

Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127
Reply from 192.168.0.133: bytes=32 time<1ms TTL=127

```

- Follow steps as provided before in “Emulation Set-up: Setting up the NetSim Client”.
- Perform the steps at Emulation Server as provided and simulate. During simulation, ping the destination system. You will notice that the present time duration is higher than the earlier ping results. This is because the network created in NetSim has link propagation delay. Also Wireshark (if installed) will automatically start capturing the packets as soon as Emulation Server starts simulation.

```

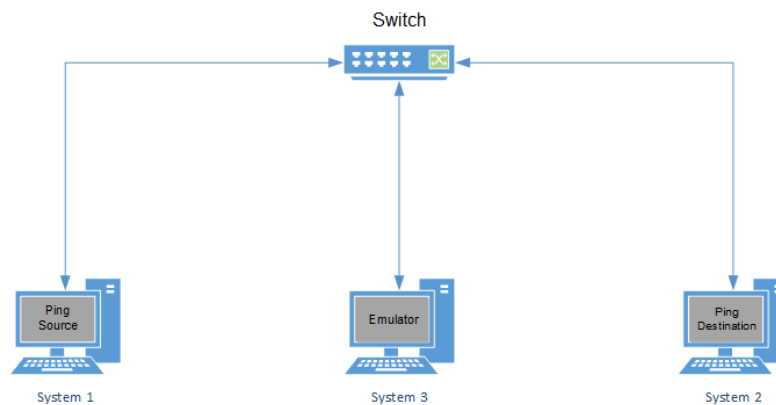

Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127
Reply from 192.168.0.133: bytes=32 time=11ms TTL=127

```

**(NOTE: In case if no ping messages can be sent from source to destination, disable windows firewall and try again.)**

- The impact of the link propagation delay in NetSim Emulator is seen on a real packet.

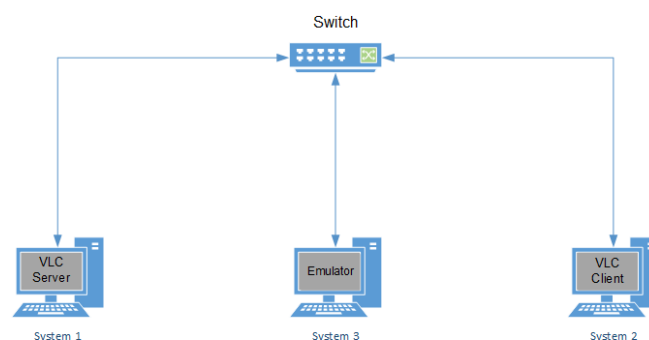

## 4.2 Example Application 1 – PING (Two-way Communication)

In PING (Two-way communication), almost all the steps are same as PING (One way communication), except that in NetSim Emulation server there will be two application instead of one. One Application will be directed from Source to Destination node, while the other application will be directed from Destination to Source node.

The difference caused in the network behaviour is that in the first case (PING -One way communication), the PING reply packets were not routed via NetSim Emulator. But in the second case (PING -Two way communication), the PING reply packets will be routed via NetSim Emulator, thereby the total delay will be approximately 21milliseconds.

## 4.3 Example Application 2 – Video (One way Communication)

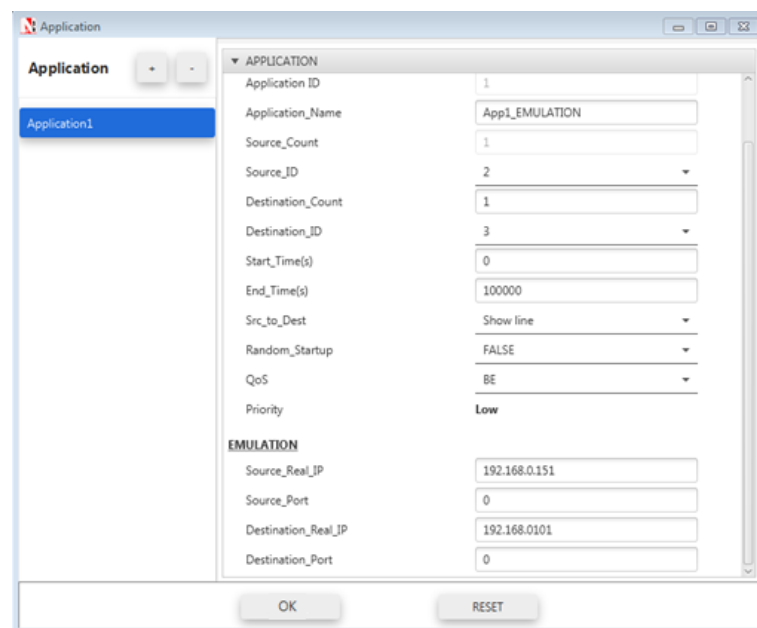

### Steps at NetSim Emulation Server:

- 1 Run NetSim in Administrative Mode and create a basic network Scenario in any stack based protocol (Any network except Legacy Networks, Wireless Sensor Network, and Cellular Network) in NetSim. Screenshot of a sample scenario in Internetworks is shown below

- i. Click on the Application icon present on the ribbon and set properties.
- ii. In the Application Type select Emulation.
- iii. Select Source and Destination ID according to the network scenario and change the Source and Destination IP address according to the IP Address of the real system and click OK.

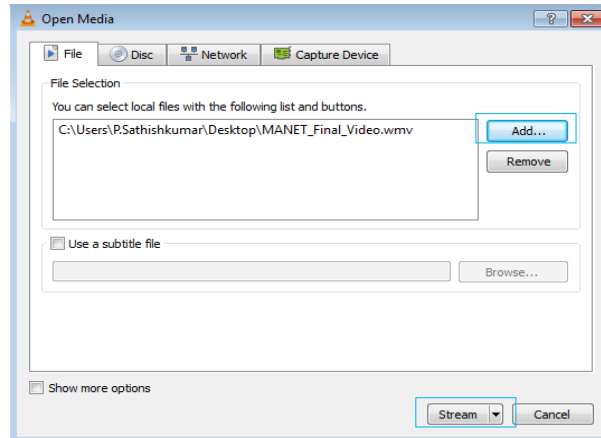

- iv. Provide the Simulation Time as how long you want the Emulation to be performed. Make sure client system(s) are ready and then click Run Simulation.

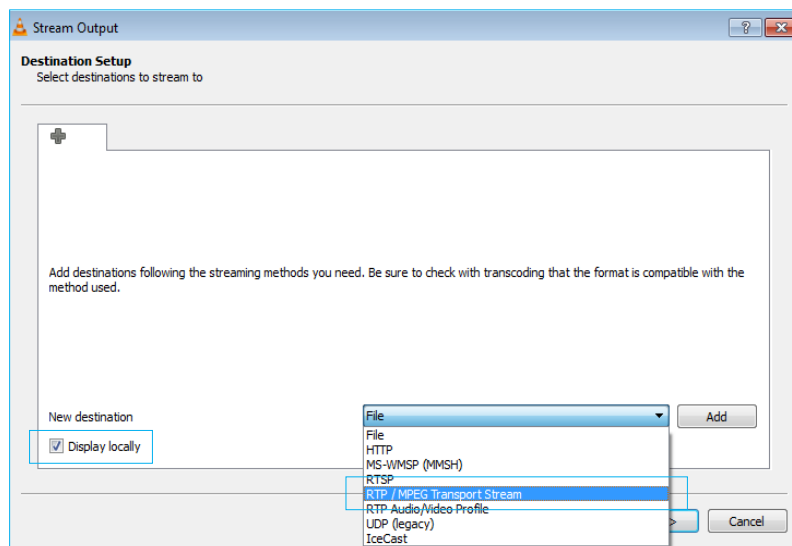

During Simulation you will notice a change in the quality of the video being played in the destination PC. This is because the network created in NetSim has errors / delays etc in the links. The impact of this loss / jitter / delay etc in NetSim Emulator is seen on a real video stream.

### Steps at Source PC:

1. Follow steps as provided before in “Running Emulation via GUI → Setting up the NetSim Client”. Then open VLC Media player → Click Media menu → Select Stream Option.
2. Click add button then select the video which you want to play

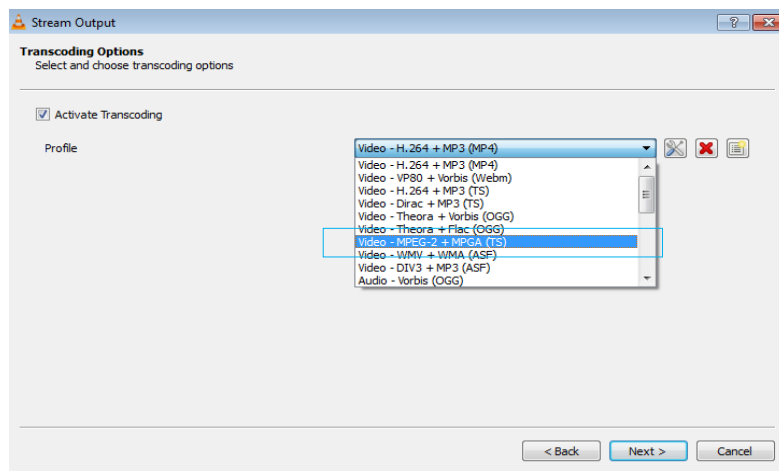

3. Click on Stream Option. Then click next button
4. Enable the display locally checkbox. Then select the RTP / MPEG Transport Stream from the drop down list as shown in the below screen shot

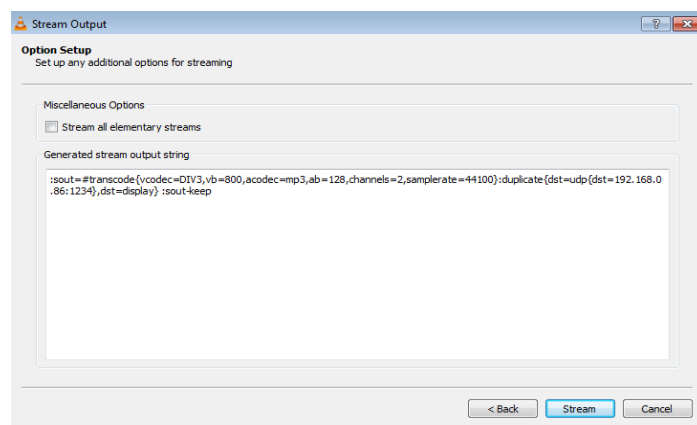

5. Click on Add Button. Then enter the Destination IP address in the Address field and enter a stream name (user defined) and click next button.

6. Select Video –MPEG-2 + MPGA (TS) option from the drop down list as shown in the below screen shot. Then click next button

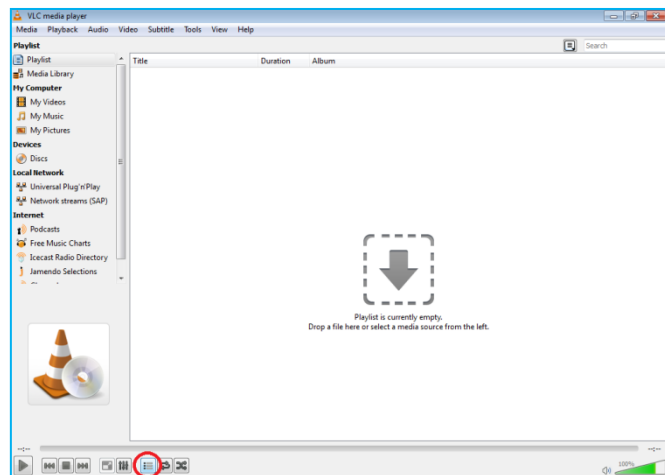

7. Perform all the steps at Emulation Server and then click on Stream button. Also Wireshark (if installed) will automatically start capturing the packets as soon as Emulation Server starts simulation.

## Steps at Destination PC:

- 1 Follow steps as provided before in “Running Emulation via GUI–Setting up the NetSim Client”. After performing all the steps at Source PC and NetSim Emulation Server, open VLC Media Player→ Click on Toggle Playlist icon as shown in the below screenshot.

*Toggle button is circled in red at the bottom of the screen shot*

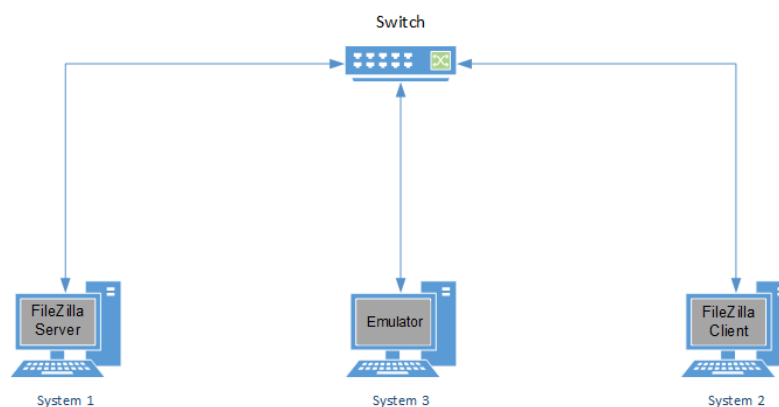

2. Double click on Network Stream (SAP) under local network. Then right click and play on the stream name that appears on the screen.

3. In the streamed video, you will notice a change in the quality of the video being played in the destination PC. Also Wireshark (if installed) will automatically start capturing the packets as soon as Emulation Server starts simulation.

#### 4.4 Example Application 3 – File Transfer using FileZilla (One-way)

##### Steps at Destination PC:

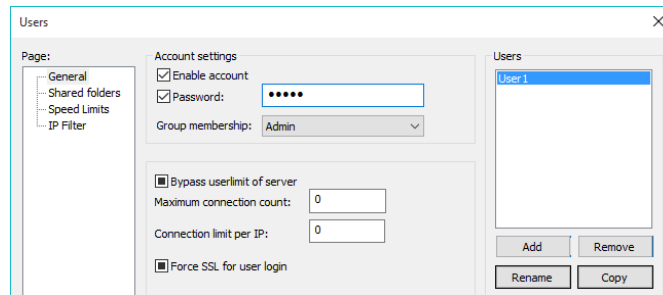

1. Follow steps as provided before in **“Emulation Set-up: Setting up the NetSim Client”**. Run FileZilla Server software. Create a group by going to Edit → Groups → Select “General” under Page: → Click Add in Groups → Give Any Name (Ex: Admin) and click ok.

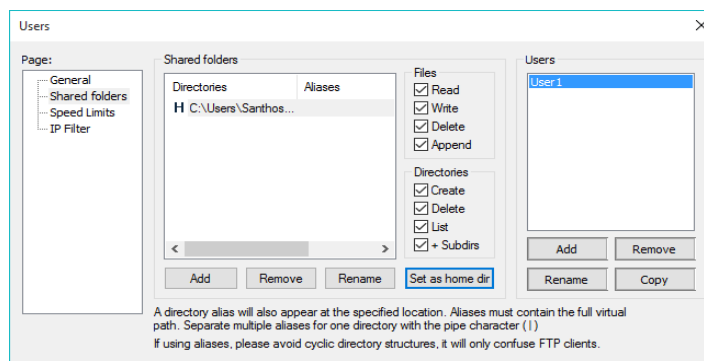

2. Go to Edit → User → General → Click Add in User → Give Any Name (Ex: User1) and Select Group what you given in Group Setting (In this case, we provide “Admin”) and click ok.

3. In Account Setting, select **Enable account** and set password and click ok.

4. Go to Shared folder → Add Folder to share (EX: FTP\_FILES from Desktop) → Select all the Files and Directories Permissions and set that folder as Home Directory by selecting “Set as Home Dir”. Click OK.

### Steps at Source PC:

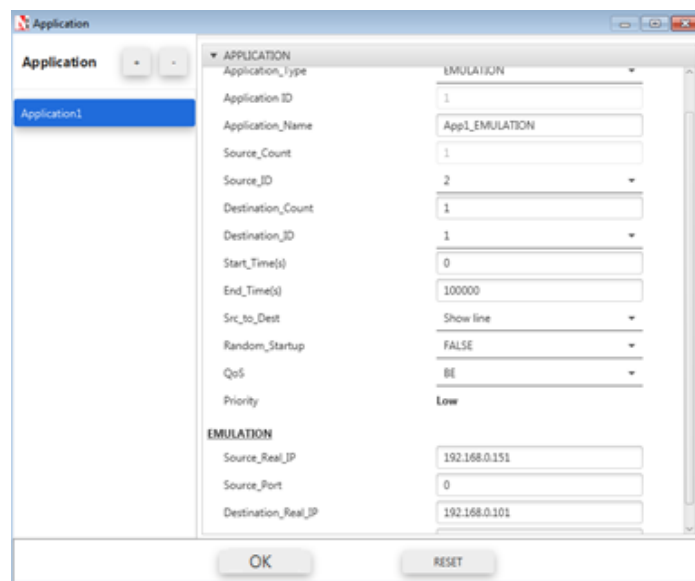

Follow steps as provided before in “Emulation Set-up: Setting up the NetSim Client”. Run FileZilla Client software. Enter the Host Name(Server System ip (EX: 192.168.0.133)) and Give the User, Password that we created in Server side and give Port No = 21. Run Emulation server and click Quick Connect. Drag and drop files from Local Site to Remote Site.

### Steps at NetSim Emulation Server:

- Run NetSim in Administrative Mode and create a basic network Scenario in any stack based protocol (Any network except Legacy Networks, Cellular Networks, and Wireless Sensor Networks) in NetSim. A sample scenario in Internetworks is performed as shown with link speed set to 1 Mbps.

- Click on the Application icon present on the ribbon and set properties.
- In the Application Type select Emulation.
- Select Source and Destination ID according to the network scenario and change the Source and Destination IP address according to the IP Address of the real system and click OK.

- Provide the Simulation Time as how long you want the Emulation to be performed. Make sure client system(s) are ready and then click Run Simulation.

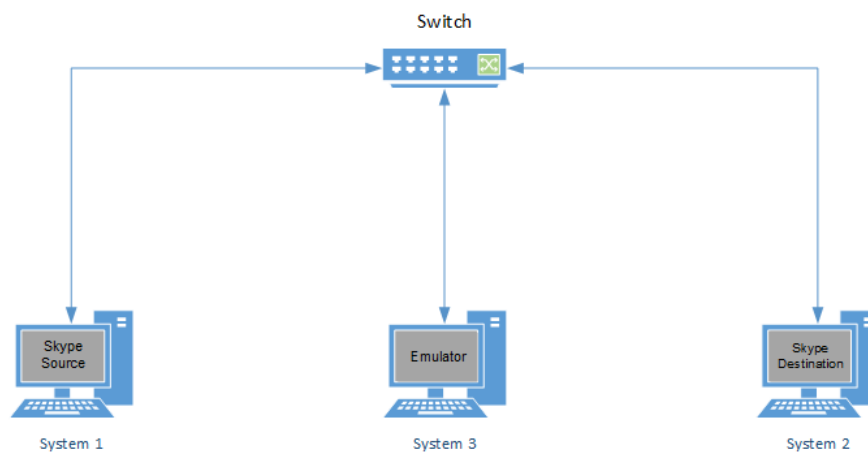

**Results: Transfer speed from client without emulation:**

Server of "/NetSim_Standard_9_0_9_WithEmulation.exe"			
	Progress	Speed	
/ithEmulatio...	114,433,360 bytes	10.9 MB/s	
120,245,749 bytes received 12,13 MB/s 1,151 bytes sent 0 B/s			

**Transfer speed from client with emulation:**

Server of "/NetSim_Standard_9_0_9_WithEmulation.exe"			
	Progress	Speed	
ithEmulatio...	29,090,728 bytes	113.4 KB/s	
29,101,933 bytes received 110,8 KB/s 1,178 bytes sent 0 B/s			

## 4.5 Example Application 4 –Skype (Two way Communication)

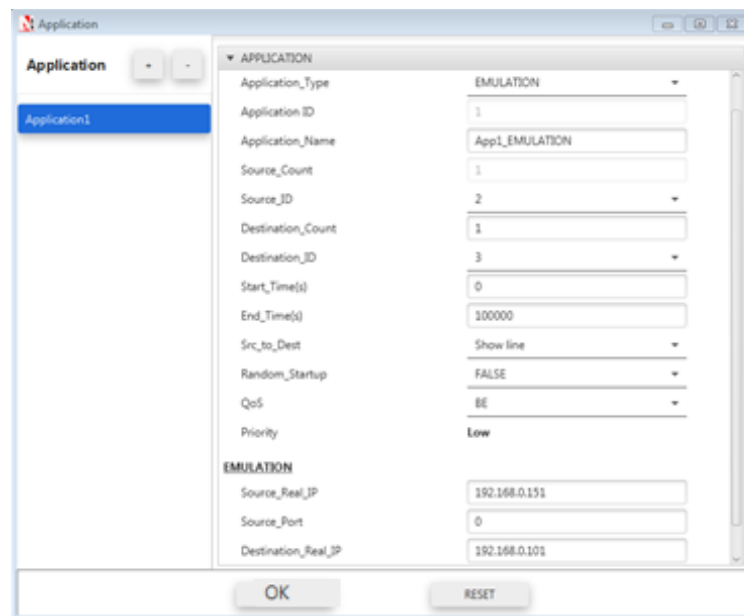

### Steps at NetSim Emulation Server:

1. Run NetSim in Administrative Mode and create a basic network Scenario in any stack based protocol (Any network except Legacy Networks, Wireless Sensor Network, and Cellular Network) in NetSim. Screenshot of a sample scenario in Internetworks is shown below.

2. Click on the Application icon present on the ribbon and set properties. . As it is two way communication, add and create two applications.
3. In both the Application Type select Emulation.
4. In one Application, select Source ID and Destination ID according to the network scenario and change the Source and Destination IP address according to the IP Address of the real system. In the second application, set the opposite of first application, i.e. Source ID and IP address will be exchanged with Destination ID and IP address. (Refer the IP settings in the screen-shot to get a clear picture)

5. Provide the Simulation Time as how long you want the Emulation to be performed. Make sure client system(s) are ready and then click Run Simulation.

### Steps at Source PC:

- 1 Follow steps as provided before in “Emulation Set-up: Setting up the NetSim Client”.

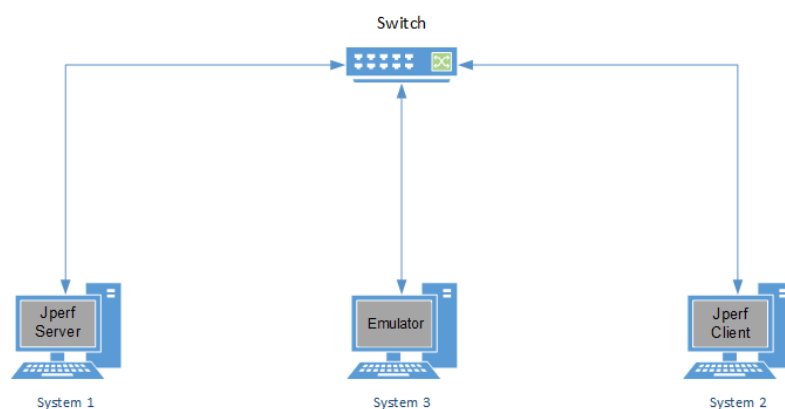

- 2 Run Skype and make a call to the destination system (Make sure that Skype is running in Destination PC).
- 3 Wireshark (if installed) will automatically start capturing the packets as soon as Emulation Server starts simulation.

#### Steps at Destination PC:

- 1 Follow steps as provided before in “**Emulation Set-up: Setting up the NetSim Client**”. After performing all the steps at Source PC and NetSim Emulation Server, open Skype.
- 2 Wireshark (if installed) will automatically start capturing the packets as soon as Emulation Server starts simulation.

## 4.6 Example Application 5 – Using JPerf

JPerf is a graphical front end for the popular network testing tool Iperf. Using JPerf you can quickly test a WAN or LAN connection to determine the maximum network throughput. The test results are automatically graphed and presented in a format that is easy to read. JPerf can also be used to detect packet loss, delay, jitter, and other common network problems.

#### Steps at NetSim Emulation Server:

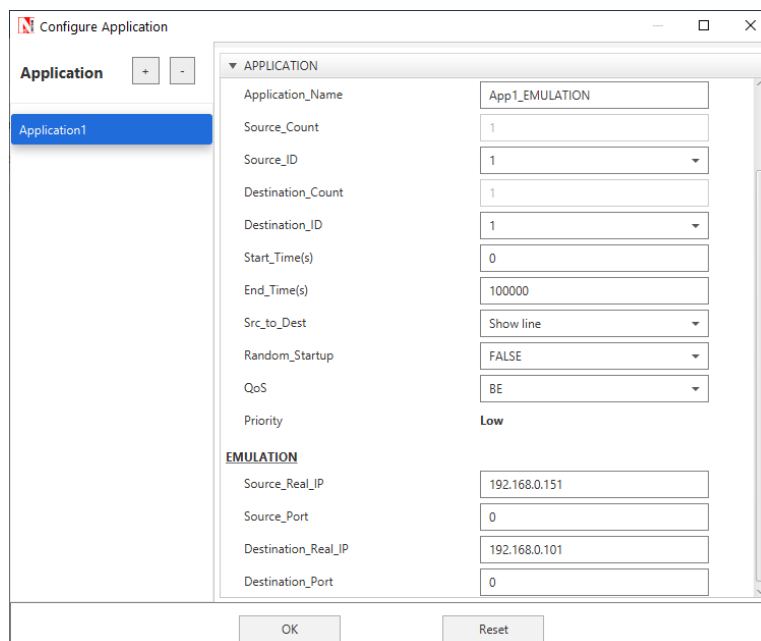

Run NetSim in Administrative Mode and create a basic network Scenario in any of the networks except Legacy Networks, Wireless Sensor Network, and Cellular Network. Screenshot of a sample scenario in Internetworks is shown below

Click on the Application icon present on the ribbon and set properties.

In the Application Type select Emulation.

Select Source and Destination ID according to the network scenario and change the Source and Destination IP address according to the IP Address of the real system and click OK.

Provide the Simulation Time as per the time for which you want Emulation to be performed. Make sure client system(s) are ready and then click Run Simulation.

### Steps at Source PC:

Follow steps as provided before in “Emulation Set-up: Setting up the NetSim Client”. Run JPerf and select Client and set Server Address as <Server IP Address>. User can edit the

Application Layer options, Transport Layer options and IP Layer options depending on the type of data they want to transmit in the network.

Do not click **“Run IPerf”** until all the steps at NetSim Emulation Server are done. Also Wireshark (if installed) will automatically start capturing the packets as soon as Emulation Server starts simulation.

### Steps at Destination PC:

Follow steps as provided before in “Emulation Set-up: Setting up the NetSim Client”. Run JPerf and select Server.

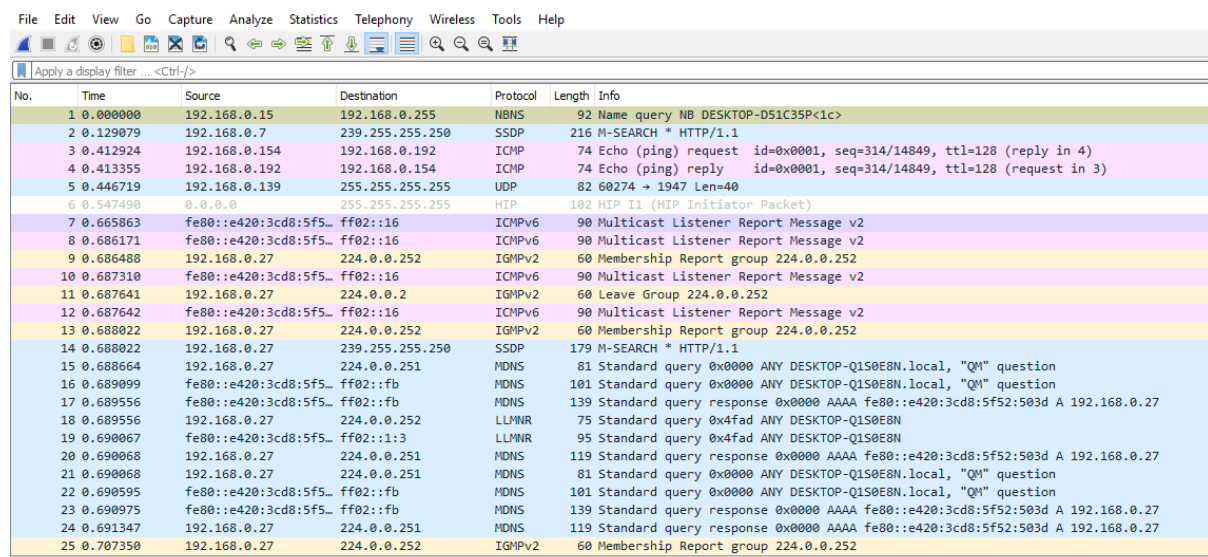

Click on **“Run IPerf”** after the Source PC starts running JPerf.

## 4.7 Providing pcap file as input to NetSim Emulator

NetSim has an inbuilt traffic generator (Application) which can be used to model unicast/multicast/broadcast traffic in the network with support for application types such as CBR, Custom, Voice, Video, FTP, Database, etc. NetSim also allows users to provide pcap file as input to NetSim traffic generator and configure applications using the real IP addresses and port numbers.

### 4.7.1 Generating a pcap file for NetSim:

Any pcap file can be provided as input to NetSim by following the procedure explained here. In this example we are generating a pcap file by running wireshark and generating traffic using ping and saved it as Raw.pcap (while saving please make sure that save as file type must be Wireshark/tcpdump/.. -pcap). Ping is initiated from the **Source IP: 192.168.0.154** to the **Destination IP: 192.168.0.192**. The pcap file will contain all incoming and outgoing packets from the system in which the capture is being done.

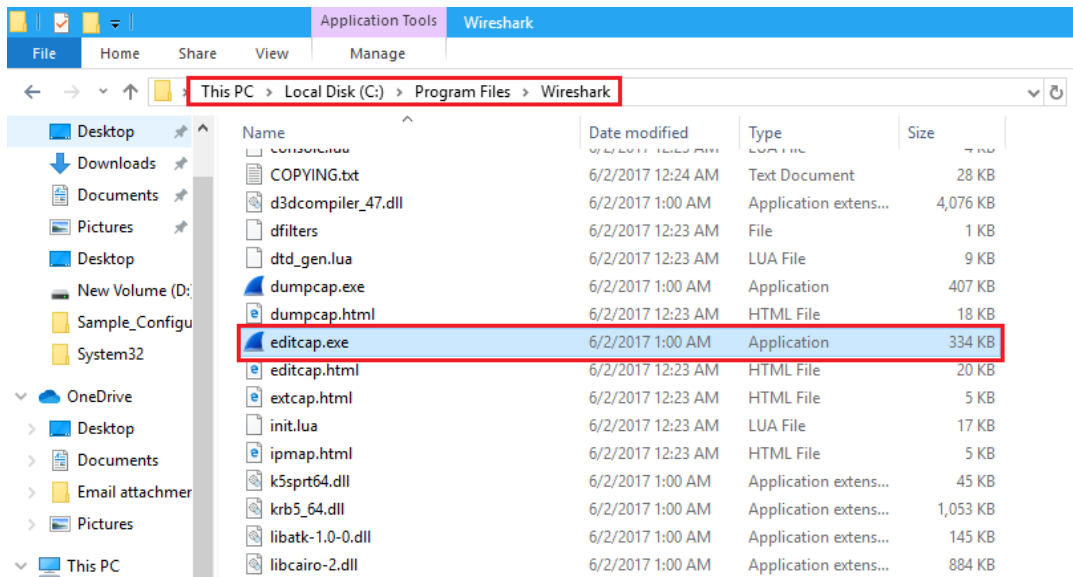

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	192.168.0.15	192.168.0.255	NBNS	92	Name query NB DESKTOP-D51C35P<1c>

Wireshark capture can be stopped after capturing required packets and saved in desired location with a user defined name (\*.pcap). Eg: **Input\_to\_NetSim.pcap**

PCAP file needs to be edited suitably before providing it as input to NetSim. The "editcap" application in Wireshark installation directory can be used to edit any pcap file to be provided as input to NetSim.

Go to wireshark installation directory [C:\Program Files\Wireshark]

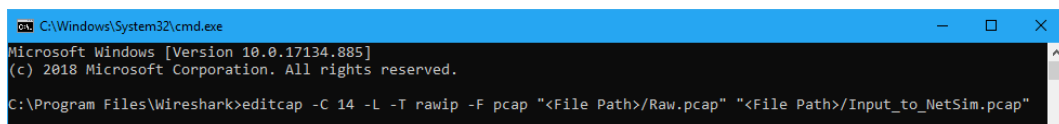

Open command prompt, and execute the following command:

**editcap -C 14 -L -T rawip -F pcap "<File Location where the file is present>/Raw.pcap"**  
**"<File Location where the file need to be saved>/Input\_to\_NetSim.pcap"**

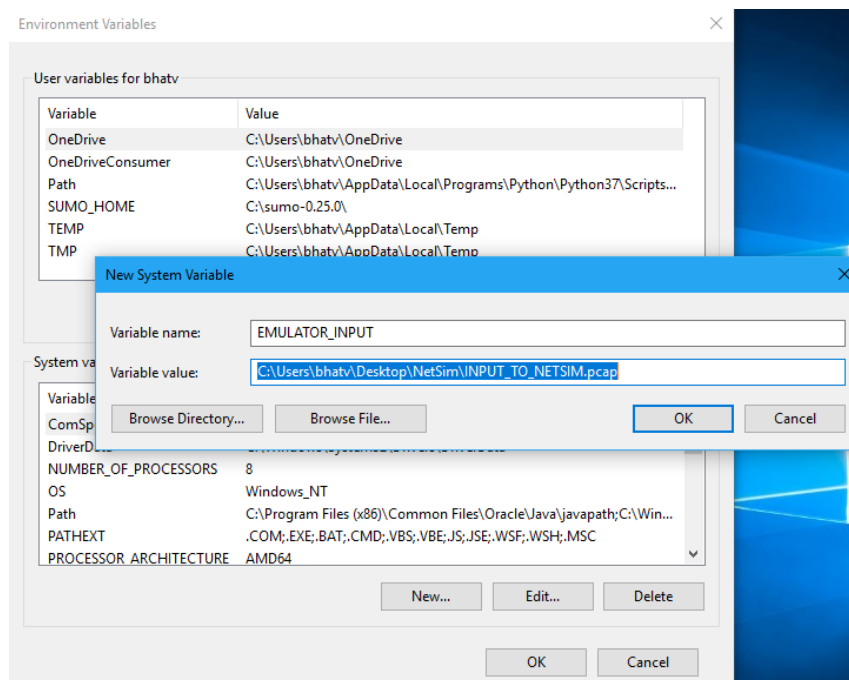

Where,

- **-C [offset:]<choplen>** chop each packet by <choplen> bytes. Positive values chop at the packet beginning, negative values at the packet end. If an optional offset precedes the length, then the bytes chopped will be offset from that value. Positive offsets are from the packet beginning, negative offsets are from the packet end. You can use this option more than once, allowing up to 2 chopping regions within a packet provided that at least 1 choplen is positive and at least 1 is negative.
- **-L** adjust the frame (i.e. reported) length when chopping and/or snapping
- **-T <encap type>** set the output file encapsulation type; default is the same as the input file. An empty "-T" option will list the encapsulation types.
- **-F <capture type>** set the output file type; default is pcapng. An empty "-F" option will list the file types.

#### 4.7.2 Providing pcap file as input to NetSim:

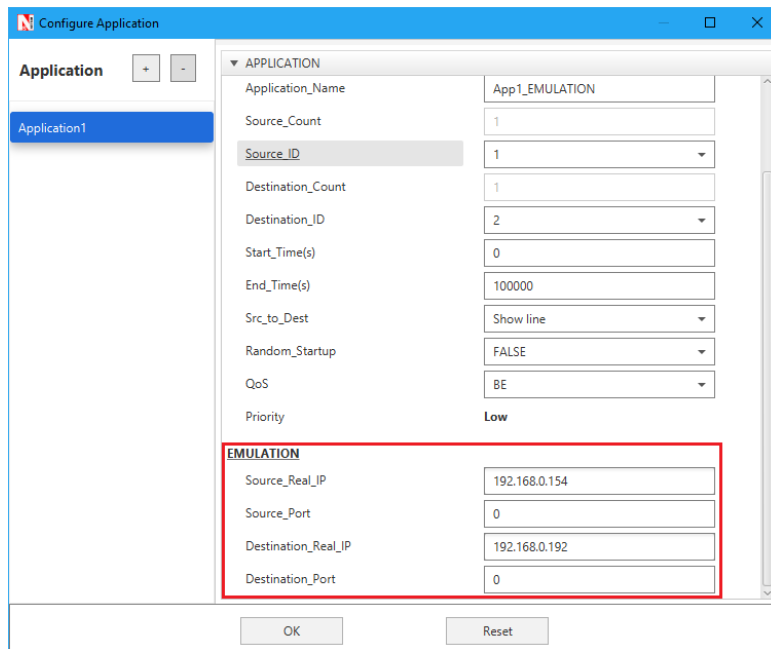

- 1 Create a system environment Variable with Variable Name as "EMULATOR\_INPUT" and value as the path of the pcap file along with the file name (Ex: C:\Users\bhatv\Desktop\NetSim\INPUT\_TO\_NETSIM.pcap).

- 2 Start NetSim as administrator. Now create a simple scenario in NetSim. For example, create a scenario in Internetworks with 1 router and 2 wired nodes as shown below. Create an Emulation application by giving the real source and destination IP's present in the pcap file. In this case we have used the IP addresses 192.168.0.154 and 192.168.0.192 which we have used for generating traffic using PING.

- 3 Run NetSim in administrator mode for Emulator application.
- 4 Now create a simple scenario in NetSim. For example create a scenario in Internetworks with 1 router and 2 wired nodes.
- 5 Create an Emulator application by giving the real source and destination IP's present in the pcap file.

- Multiple applications can be configured based on the packets captured. For instance there can be one more application configured for packets from 192.168.0.192 to 192.168.0.154
- NetSim Emulator will read the packets from pcap file as per the source and destination that we are giving in the application properties.
- After simulation, NetSim results window provides Packet Capture Metrics. Here users can observe 4 different types of log files as explained in section 3.1
- Open Dispatch to Emulator packets, it contains only the packets whose source and destination IP addresses match with the source and destination IP addresses that we have configured.

## 5 Latest FAQs

Up to date FAQs on NetSim's Emulation library is available at <https://tetcos.freshdesk.com/support/solutions/folders/14000115083>
